White males show fewer single and widowed and more married than negroes or Indians. The proportion of Indian males 15 to 20 years of age that are married is twice as great as that for negroes and four times as great as that for whites at the same age. These differences between the races decrease, and after 35 years of age become insignificant.

White females have fewer single and more married than either negroes or Indians. The proportion of widowed is less than that for negroes but greater than that for Indians. The proportion of females 15 to 20 years of age that are married among Indians, negroes, and whites are as five, three, and two. These differences between the races decrease during the succeeding age periods, and after 45 years the proportion of white wives is greater than that for either of the other races.

At all age periods the proportion of widowed is less among adult whites of either sex than among negroes and Indians.

DISCUSSION OF MARITAL CONDITION.

Definitions.—By marital condition, conjugal condition, or civil condition, is meant the relation of the population to the social institution of marriage. Every person in the community at a given day, like the day for which a census speaks, is either married or not married. The not-married fall into two classes—those who have never been married, and those who have been married, but whose married life ended before the census day. The latter fall into two classes, according as their married life ended by death of the other party to the marriage or by divorce. The population with reference to marital condition thus falls primarily into four classes: (1) The single, those who have never been married; (2) the married, those who have a husband or wife living; (3) the widowed, those who have been married, but whose married life has been ended by the death of the other party; and (4) the divorced, those who have been married, but whose married life has been ended by a legal decree. To these must be added (5) the unknown, a small class embracing those for whom the question is unanswered.

The census figures for marital condition show merely the facts at the date of the census and give no information regarding prior marital experience. A person reported as married on the census day may have been married one or more times before the then subsisting union, and any one of those prior marriages may have been ended either by death or by divorce. Every person begins life single, but the married, widowed, and divorced may have had, and in individual instances have had, between their birth and the date of the census, all possible successions of relations to the institution of marriage.

Accuracy of figures.—In the field of marital statistics ignorance is a source of some errors. The question whether at a given time A and B were married, is often difficult for a court to determine, and in not a few instances A and B, or one of them, are mistaken about the facts. Mistakes are still more likely to be made by third persons from whom the information is often obtained. Many other errors arise from conscious misrepresentation. A man who reports himself as married admits thereby certain duties and obligations; a woman making a similar statement usually asserts a right rather than admits an obligation. A husband who has abandoned his wife and is living apart from her is tempted to report himself as single, while she is likely to report herself correctly as married, or incorrectly as widowed. The popular application of the term "grass widow" or less often "grass widower" to married persons temporarily or permanently separated may possibly exercise some influence upon the figures. The unmarried father of an illegitimate child is almost sure to report himself correctly as single; the mother is tempted to report herself incorrectly as married, widowed, or divorced. Intentional misrepresentation thus affects the returns for the two sexes in opposite directions, leading to an understatement of the true number of married men and an overstatement of the true number of married women. The influence of this error upon the figures for the white population is masked by the fact that the immigrants include many men whose wives are still in foreign countries, but this complication hardly affects the negro population. At the Twelfth Census there were 1,423,039 negro husbands and 1,444,533 negro wives, an excess of 21,494 wives over husbands. It is not likely that many of these were married to white men. A large majority were probably returned incorrectly. Even if it is assumed that all the negroes of unknown marital condition were married, there would still remain in the United States, according to the returns, 13,877 more negro wives than negro husbands.

The margin of error in the number of divorced persons is probably wider than in any other class. This is the only marital condition which entails in most communities some social condemnation. It is likely not to be admitted in many cases where it actually exists, and the reported number of divorced persons is probably, therefore, a serious understatement of the true number.[1] But the reported number of divorced persons is so small that not even its transfer to any one of the other three classes, much less its distribution among them, would seriously mar the accuracy of those figures. It is probable, therefore, that the returns for the single, the married, and the widowed are sufficiently trustworthy to furnish a basis for the inferences herein stated. No means are available for determining the probable error of the answers in any one of these forms of marital condition.

In considering the accuracy of the figures it must be borne in mind that the enumerators have no means of checking the correctness of the answers. Where persons are living together as husband and wife, they are sometimes returned as such where investigation would show that they were not legally married. An illustration of this condition may be quoted from a description of the negroes on a Louisiana plantation. "Of 40 couples at Cinclare who reported themselves as married * * * only 20 were legally married in the church or by the civil authorities. * * * Numerous cases are seen of two persons legally married and yet each living

[1] Assuming that the increase in the number of divorces granted in the United States between 1867 and 1886, the limits of the twenty-year period for which alone the facts have been gathered, continued until 1900, there would have been 36,929 divorce decrees recorded in the United States in that year, resulting in 73,858 divorced persons. At this rate it would have required only 2.7 years to produce the 198,914 divorced persons found by the census. It seems hardly likely that the probable duration of life as a divorced person before remarriage or death can be so low as 2.7 years. If it is not, then the increase of divorce in the United States must have been much checked since 1886—an improbable assumption—or the census returns in this particular must be an understatement of the truth.

with a different person and reporting as being married to the second."[1]

In the United States generally the mere exchange of consent between competent parties constitutes the marriage, or as it is expressed in a standard treatise: "To render competent parties husband and wife they must and need only mutually agree in the present tense to be such—no time being contemplated to elapse before the assumption of the status."[2] In Porto Rico, on the contrary, under the Spanish régime a religious ceremony was essential to constitute the marriage, and the cost of it was sufficient to debar the poorest classes from legal entrance upon the marriage state. As a consequence, when the census of Porto Rico was taken in 1899 many cases were found in which men and women were living in the same household but bearing different names, and a number of children were also reported bearing the mother's name. Such persons were evidently cohabiting as husband and wife, but without legal sanction. The like class in the United States, as illustrated by the preceding quotation, would be reported as married. In the Census of Porto Rico they are made a special class, under the designation of persons living together by mutual consent.[3]

TOTAL POPULATION.

International comparisons.—In 1900 the population of continental United States belonged to the five marital classes in the following proportions:

TABLE I.—*Distribution, by marital condition, of total population: 1900.*

MARITAL CONDITION.	TOTAL POPULATION: 1900.	
	Number.	Per cent.
Continental United States	75,994,575	100.0
Single	43,983,965	57.9
Married	27,770,101	36.5
Widowed	3,895,847	5.1
Divorced	198,914	0.3
Unknown	145,748	0.2

These figures show that nearly three-fifths of the population (57.9 per cent) are single—that is, have never been married; that rather more than two-fifths (41.9 per cent) are or have been married; that about one-eighteenth of the population (5.4 per cent) have ended their married life as a result of death or divorce; and that the widowed and divorced amount to nearly one-seventh of the married.

The following table shows the per cent of the population belonging to each of these classes in the United States and in various other countries:

[1] Department of Labor, Bulletin 38, page 102, "The Negroes of Cinclare Central Factory and Calumet Plantation, Louisiana."
[2] Bishop on Marriage, Divorce, and Separation, section 299.
[3] War Department, Census of Porto Rico, page 65.

[1] Less than one-tenth of 1 per cent.

A comparison of the per cents for the countries included in the preceding table shows that in only 1 of these countries—India—is less than half the population single; that in only 4—France, Hungary, Bulgaria, and Spain—is less than 55 per cent single; that in each of the 28 countries outside of Europe, except India, the proportion of single is greater than it is in continental United States; that the same is true of 12 of the European countries; and that the 6 European countries with a smaller proportion of single—Servia, Bulgaria, Hungary, Italy, Spain, and France—are mainly countries of eastern and southern Europe in which it is the custom to marry early. The table shows that the United States has a smaller proportion of single than any other country which has been settled by European immigrants, and smaller also than the countries of northern and northwestern Europe.

As continental United States has a small proportion of single, it must have a large proportion of those who are or have been married. The great majority of this class were married at the date of the census, and therefore there must be in continental United States a large proportion of married. In fact no non-European country in the table, except India, and of the 18 European countries only 5—Hungary, Bulgaria, Servia, France, and Spain—had a larger proportion of married than continental United States.

There are fewer widows and widowers in continental United States relative to population than in any of the European countries, except Bulgaria and Servia, but more than in Cape of Good Hope or any of the Australasian colonies, and more than in 10 of the 18 American countries included in the table.

In many countries there is no return made of the divorced, but of the 23 countries making this return, when compared with continental United States, only Switzerland shows a higher and only Denmark as high a per cent of divorced.

These comparisons show that the population of continental United States has a small proportion of single, a large proportion of married, an average proportion of widowed, and a large proportion of divorced.

Main and minor geographic divisions. In the following table the per cent of the total population belonging to each marital class is given for each main and minor geographic division.

TABLE III.—*Per cent distribution, by marital condition, of total population for main and minor geographic divisions: 1900.*

DIVISION.	PER CENT DISTRIBUTION OF TOTAL POPULATION: 1900.				
	Single.	Married.	Widowed.	Divorced.	Unknown.
Continental United States	57.9	36.5	5.1	0.3	0.2
North Atlantic division	55.5	38.3	5.8	0.2	0.2
New England	54.2	38.8	6.4	0.3	0.3
Southern North Atlantic	55.9	38.2	5.6	0.1	0.2
South Atlantic division	61.0	33.6	5.0	0.2	0.2
Northern South Atlantic	60.1	34.3	5.2	0.2	0.2
Southern South Atlantic	61.7	33.1	4.9	0.1	0.2
North Central division	57.1	37.8	4.7	0.3	0.1
Eastern North Central	55.9	38.6	5.0	0.3	0.2
Western North Central	58.9	36.5	4.2	0.3	0.1
South Central division	60.6	33.9	5.1	0.3	0.1
Eastern South Central	60.3	34.0	5.3	0.3	0.1
Western South Central	60.9	33.7	4.9	0.3	0.2
Western division	58.1	36.1	4.8	0.5	0.5
Rocky Mountain	58.3	36.5	4.2	0.5	0.5
Basin and Plateau	60.6	34.1	4.5	0.5	0.3
Pacific	57.4	36.3	5.2	0.6	0.5

The table shows that the largest proportion of single is found in the Southern South Atlantic division (61.7 per cent) and the smallest in New England (54.2 per cent), both extremes being found thus on the Atlantic coast. This fact suggests, what inspection of the table will confirm, that the differences between South and North are far greater than those between East and West. To show this, the figures for the two northern and the two southern divisions have been combined, with the following results:

TABLE IV.—*Per cent distribution, by marital condition, of total population for the North and the South: 1900.*

MARITAL CONDITION.	PER CENT DISTRIBUTION OF TOTAL POPULATION: 1900.		
	Continental United States.	The North.	The South.
Total	100.0	100.0	100.0
Single	57.9	56.4	60.8
Married	36.5	38.0	33.7
Widowed	5.1	5.2	5.1
Divorced	0.3	0.2	0.2
Unknown	0.2	0.2	0.2

The above per cents reduced to a per 1,000 basis show that in each 1,000 of northern population there were 44 less single and 43 more married than in each 1,000 of southern population. The figures of single and married for the Far West lie between those for the North and the South.

States and territories. —In Table v similar figures of marital condition are given for each state and territory in 1900.

Vermont has the smallest proportion of single (50.1 per cent) and North Dakota the largest (64.0 per cent). Vermont has the largest proportion married (42.3 per cent) and South Carolina the smallest (32.4 per cent). New Hampshire has the largest proportion of widows and widowers (7.3 per cent) and North Dakota the smallest (2.8 per cent). Nevada has the largest proportion of divorced persons (0.7 per cent), while several states along the Atlantic coast from New York to South Carolina have only one divorced person per 1,000. The untrustworthiness of these statistics of divorced persons, however, is illustrated by the figures for South Carolina. That state has never had a law allowing courts to issue divorces except during the seven years, 1872 to 1878, and during that period only 157 divorces were granted; yet the census reported, in 1900, 1,081 persons as divorced, four-fifths of them negroes.

The states with a proportion of single above the average for the country include every Southern state, except Delaware and the District of Columbia, and 12 of the 18 states and territories in the Western North Central and Western divisions. The great area in which the proportion of single is below the average for the country is found in the North Atlantic and the Eastern North Central groups, Wisconsin alone among the 14 states in this area having a proportion of single above the average. This area agrees approximately with the area of densest population and with that containing the largest proportion of urban population.

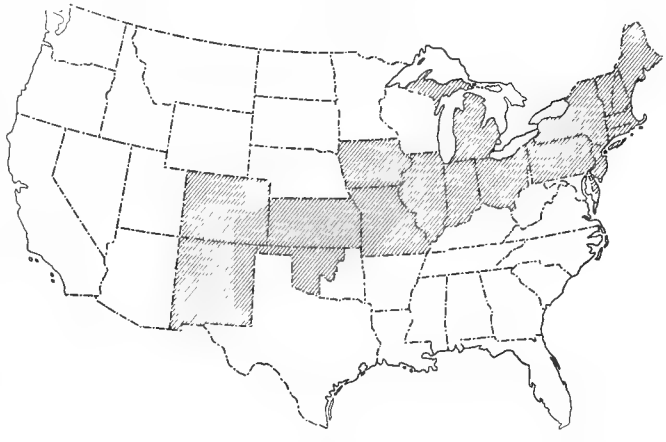

TABLE V.—*Per cent distribution, by marital condition, of total population, for states and territories: 1900.*[1]

STATE OR TERRITORY.	PER CENT DISTRIBUTION OF TOTAL POPULATION: 1900.				
	Single.	Married.	Widowed.	Divorced.	Unknown.
Continental United States	57.9	36.5	5.1	0.3	0.2
North Atlantic division	55.5	38.3	5.8	0.2	0.2
New England	54.2	38.8	6.4	0.3	0.3
Maine	50.8	41.4	7.0	0.5	0.3
New Hampshire	50.7	41.2	7.3	0.6	0.2
Vermont	50.1	42.3	6.8	0.5	0.3
Massachusetts	55.6	37.6	6.3	0.2	0.3

Montana	61.7	33.7	3.6	0.5	0.5
Idaho	61.5	34.5	3.1	0.5	0.1
Wyoming	63.5	32.6	3.1	0.4	0.4
Colorado	55.5	38.6	4.7	0.5	0.7
New Mexico	56.7	37.7	5.0	0.5	0.1
Basin and Plateau	60.6	34.1	4.5	0.5	0.3
Arizona	58.8	34.8	5.3	0.5	0.6
Utah	61.9	33.6	3.9	0.4	0.2
Nevada	57.8	35.2	5.8	0.7	0.5
Pacific	57.4	36.3	5.2	0.6	0.5
Washington	59.0	35.8	3.8	0.5	0.9
Oregon	58.3	36.4	4.4	0.6	0.3
California	56.6	36.4	5.9	0.6	0.5
The North	56.4	38.0	5.2	0.2	0.2
The South	60.8	33.7	5.1	0.2	0.2

[1] The figures on which these per cents are based may be found in Twelfth Census Abstract, Tables 35 and 63.

The states with a proportion of married above the average extend in a band across the country from Maine to New Mexico, dividing the country thus into three sections: A northwestern section, from Wisconsin to California, with a low proportion of married; a southeastern section, from Maryland to Texas, also with a low proportion of married; and an intervening belt, with a high proportion of married. This appears more clearly from the accompanying sketch map, that shows the states in which the proportion of married is above the average for continental United States:

MAP 42.—*States in which the proportion married is above the average: 1900.*

The proportion of widowed is above the average in two distinct sections, an eastern section including 19 of the 27 states east of the Mississippi (the exceptions being Pennsylvania, West Virginia, North and South Carolina, Kentucky, Michigan, Illinois, and Wisconsin), and with them Louisiana and Arkansas, and a far southwestern section, including California, Nevada, and Arizona.

Notwithstanding the probable inaccuracy of the figures for divorced persons, it may be worthy of mention that the states with a proportion of divorced above the average are the 4 less populous New England states—Maine, New Hampshire, Vermont, and Rhode Island—Michigan, Indiana, and every state and territory of the Western division. These conclusions agree in the main with indications from the report of the Department of Labor, and may be accepted as an approximate indication of the areas in which divorce is most common.

City and country.—The marital condition of the population is reported for all incorporated places having at least 25,000 inhabitants. By subtracting the totals of these figures from those for the whole country, the figures for what may be called in distinction the rural population are obtained. The results appear in the table following:

TABLE VI.—*Distribution, by marital condition, of total population in cities having at least 25,000 inhabitants and in smaller cities or country districts: 1900.*

MARITAL CONDITION.	TOTAL POPULATION: 1900. Total.	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.	Per cent distribution. In cities having at least 25,000 inhabitants.	In smaller cities or country districts.
Continental United States	75,994,575	19,718,312	56,276,263	100.0	100.0
Single	43,983,965	11,186,738	32,797,227	56.7	58.3
Married	27,770,101	7,263,399	20,506,702	36.8	36.4
Widowed	3,895,817	1,165,644	2,730,203	5.9	4.8
Divorced	198,914	51,589	147,325	0.3	0.3
Unknown	145,748	50,942	94,806	0.3	0.2

The only noteworthy difference brought out by these figures is the much larger proportion of widowed in the cities; apparently there is no great difference between city and country in the proportion of single and married. But nearly three-fourths (73.2 per cent) of the population living in cities of at least 25,000 inhabitants are in the North Atlantic and Eastern North Central states, as shown in the section on population, and the proportions of single and married in the North differ widely from those in the South. If the tendencies in the South and the tendencies in city life should be in the same direction, each might obscure the other in Table VI. Accordingly, the comparison between cities and country in the entire continental United States should be supplemented by another giving proportions for city and country merely in the Northern states east of the Mississippi. That is done in the following table:

TABLE VII.—*Per cent distribution, by marital condition, of total population, in cities having at least 25,000 inhabitants and in smaller cities or country districts, for the North Atlantic and Eastern North Central divisions: 1900.*

	PER CENT DISTRIBUTION OF TOTAL POPULATION: 1900. Single.	Married.	Widowed.	Divorced.	Unknown.
North Atlantic and Eastern North Central divisions	55.7	38.4	5.5	0.2	0.2
Cities having at least 25,000 inhabitants	56.9	37.1	5.6	0.2	0.2
Smaller cities or country districts	54.9	39.3	5.4	0.3	0.1

The table shows that in this area the proportion widowed is almost the same in city and country, and that the main difference between urban and rural population is found in the larger proportion of single in the cities and of married in the country.

Sex.—Attention has been called previously (page 86) to the fact that there are over one and a half million more males than females in the United States, while in most of the countries of western Europe and in that continent as a whole there are more females than males. In countries where marriage is monogamic and either sex materially outnumbers the other, the proportion of married must be greater in the sex which is in the minority. The following proportions for continental United States illustrate this fact:

TABLE VIII. *Per cent distribution, by marital condition, of male and female population: 1900.*[1]

MARITAL CONDITION.	PER CENT DISTRIBUTION OF MALE AND FEMALE POPULATION: 1900. Total.	Male.	Female.
Continental United States	100.0	100.0	100.0
Single	57.9	60.5	55.1
Married	36.5	36.0	37.2
Widowed	5.1	3.0	7.3
Divorced	0.3	0.2	0.3
Unknown	0.2	0.3	0.1

[1] The figures on which these per cents are based may be found in Twelfth Census, Volume II, Table XLII.

The figures show that in 1,000 females there were 12 more married than in 1,000 males. The single males were more numerous than the single females by 54 in each 1,000 and the widows more numerous than widowers by 43 in each 1,000.

These per cents must not be interpreted as indicating the relation between the actual numbers. To be sure there are in the United States three million more single males than single females and one and a half million more widows than widowers. It might be thought at first that the number of husbands and of wives must be equal, but in fact the enumerated husbands exceeded the enumerated wives by nearly 150,000. This does not point to the existence in the United States of polyandrous conditions or communities, but rather to the fact that many immigrant husbands have left their wives behind them. The excess of 150,000, or more accurately, 142,527 husbands, does not measure this current; on the contrary it is a minimum limit to the truth. Were it not for the influence of immigration the census would doubtless have reported in the entire population, as it did in the negro population, more wives than husbands. The reasons for this are stated in a previous paragraph (page 385).

The distribution of the several classes of single, married, and widowed may vary in different parts of the United States, as it varies in the United States as a whole when compared with the leading foreign countries. Where females outnumber males, as they do in most of the states along the Atlantic coast, the proportion of spinsters is likely to be large and of bachelors small; where males outnumber females, as in all states west of the Mississippi, the proportion of spinsters is likely to be small and of bachelors large. The following table gives the per cent distribution by sex:

TABLE IX.—PER CENT DISTRIBUTION, BY MARITAL CONDITION, OF MALE AND FEMALE POPULATION, FOR STATES AND TERRITORIES: 1900.[1]

[1] The figures on which these per cents are based may be found in Twelfth Census Abstract, Table 62.

[2] Less than one-tenth of 1 per cent.

The table shows that the largest proportion of single among the male population is found in the far Western states—Wyoming 68.7 per cent, North Dakota 67.3 per cent, Montana 67.2 per cent, Idaho 66.5 per cent -thus confirming the anticipation; but the next state in order is South Carolina, in which there is an excess of females. The states with smallest proportion of single among the male population are the three northern New England states—Maine 53.4 per cent, New Hampshire 53.0 per cent, and Vermont 52.9 per cent—two of which have an excess of males. The proportion of single in the female population is largest in the Carolinas and smallest in northern New England. These and other inferences derivable from the table show that the preponderance of one or the other sex in the total population is not the prime or controlling factor in determining the proportion of single, married, or divorced. A very large proportion of the population is single simply because at the date of the census it had not reached a marriageable age. It is usual to fix the beginning of the marriageable period at 15 years. To be sure 4,587 children under 15 were reported by the census as married, widowed, or divorced, but many of these were cases of incorrect returns either of age or of marital condition, and even if they be all accepted as correct, they amount to only about one in each 2,000 children 10 to 14 years of age in the country, or, as most of them are girls, about one in each 1,000 girls 10 to 14 years of age. Assuming, then, the marriageable age to begin at 15, the proportion of single or married in the population will be affected by the proportion of children.

The question then arises whether that differs widely in different parts of the country. That it does is clearly indicated by the following figures:[1]

DIVISION.	PROPORTION OF CHILDREN AND OF ADULTS PER 10,000 TOTAL POPULATION OF ALL AGES: 1900.		
	Children under 15 years of age.	Adults 15 years and over.	Age unknown.
Continental United States	3,438	6,535	27
North Atlantic	2,976	7,004	20
Western	3,021	6,912	67
North Central	3,363	6,617	20
South Atlantic	3,902	6,071	27
South Central	4,045	5,920	35

The figures show that in 10,000 persons of the South Central group there are 1,069 more children and 1,084 fewer adults than in 10,000 persons of the North Atlantic division, a difference probably great enough to mask entirely any influence of the diverse sex proportion of the several sections. To allow for this difference the children under 15 years of age may be subtracted and the per cent of single, married, widowed, and divorced among the adult population found.

ADULT POPULATION.

International comparisons.—The following table gives the proportion of all persons and of all males and females 15 years and over who were single, married, widowed, divorced, or unknown in the specified foreign countries:

[1] Less than one-tenth of 1 per cent.

Continental United States has a smaller proportion of single in its adult population than any other country in the table, except France and Mexico. It has a larger proportion married than any other country in the table. It has a smaller proportion widowed than any European country, but larger than any of the Australasian colonies and larger than a number of the colonies or countries of European origin in other parts of the world.

In general, then, the adult population of continental United States is characterized by a large proportion of persons who are living in the married state and by small proportions of persons who have never entered that state and of persons who have passed through it and are living again as single.

Among adult males only Denmark and France had a smaller proportion of bachelors than continental United States; among adult females only the Cape of Good Hope had fewer spinsters. Both the European countries just named had a slightly larger proportion of husbands and the Cape of Good Hope and Queensland a larger proportion of wives. There were fewer widowers in continental United States than in any European country in the table, except Austria, and fewer widows than in any European country, except the Netherlands, though the per cent of widows is the same in Belgium as in continental United States.

States and territories. —Table XI gives the proportion of all persons and of males and females 15 years and over who are single, married, widowed, divorced, or unknown in the states and territories of the United States in 1900.

The regions in which at least two-fifths of the adult population are single are the three Pacific coast states with Nevada, the three northern frontier states with Wyoming, these two areas being separated by two states, Utah and Idaho, in which the Mormon church may have exercised an influence upon the habits of the community. The only other region with a large proportion of single adults is the District of Columbia, which suggests, as a point to be subsequently examined, that city life may be less favorable to marriage than country life. The states with less than one-third of their adult population single are widely scattered — Maine, Vermont, Georgia, Michigan, Indiana, Arkansas, Indian Territory, Oklahoma, and New Mexico; but all agree in having at least one-half, and with the exception of Maine at least three-fifths, of their population living outside of places having at least 2,500 inhabitants.[1]

The states in which the largest proportion of the adult population is married are especially the states and territories of the Mississippi valley with a small urban population, such as Oklahoma, Indian Territory, Indiana, Kansas, Arkansas, Texas, Iowa, and Nebraska. They include, also, New Mexico, Michigan, and Vermont. Why New Mexico should have a much higher proportion of married adults than Arizona, or Michigan than Wisconsin, or Vermont than any other state in the Atlantic division, is not clear from the table. Still the figures indicate that as a rule the largest proportion of married among adults is found in the younger agricultural states with a relatively small urban population. Of the adult population of Alaska only about one-third (34.7 per cent) is married. The other states in which less than half the adults are married are Montana, Wyoming, Nevada, California, Hawaii, and in the East the District of Columbia.

While the married in the District of Columbia are relatively few, the widowed are more numerous than in any other part of the country, 11 per cent of the adults being widows or widowers. Next to this are the three northern New England states, and Alabama, Mississippi, and Louisiana, in each of which there was more than 9 per cent widowed among the adults. The smallest proportion of widowed, less than 7 per cent of the adults, is found in a band of states including all the Western North Central, except Missouri; all the Western division, except New Mexico, Arizona, Nevada, and California; and in the Western South Central, Oklahoma. Outside of these there is only West Virginia in this group.

[1] Section on population, Table x.

[1] Less than one-tenth of 1 per cent.

Turning to a consideration of the proportions for adult males, the table shows four states—Wyoming, Montana, Nevada, and Washington—in which more than half of them are single. Comparison of the figures with those showing per cent of males in total population[1] indicates that these are the four states with greatest relative excess of males, and that the order of these states is the same in the two series. But the order of the states must obviously be affected by the proportion of children in the population. To exclude this cause of error the per cent of males in the total adult population has been computed. The two series are placed side by side in the following table, which includes all states and territories having at least 55 per cent of males in their adult population:

TABLE XII.—*Rank in order of decreasing per cent male in total population and decreasing per cent single in adult male population, for states and territories having at least 55 per cent male in total adult population: 1900.*

STATE OR TERRITORY.	Per cent male in population 15 years and over.	Rank in order of decreasing per cent single in male population 15 years and over.	Per cent single in male population 15 years and over.
Wyoming	67.9	1	58.2
Montana	66.2	2	56.8
Nevada	63.6	3	53.1
Washington	62.2	4	50.4
Arizona	61.9	5	49.5
Idaho	61.6	6	49.3
Oregon	58.8	9	47.8
North Dakota	58.7	7	49.0
California	56.9	8	48.8
Colorado	56.6	11	44.0
Oklahoma	55.7	36	38.5
South Dakota	55.6	12	43.9
Indian Territory	55.1	37	38.4
New Mexico	55.0	46	36.9

The table shows that the 10 states with highest per cent male among adults rank in almost the same order in reference to per cent single among adult males. From that point on, no correlation can be detected between the two series. Oklahoma, for example, is eleventh in order of per cent male in the adult population but thirty-sixth in the order of per cent single among the adult males. The inference is that the proportion of the sexes among adults is a factor influencing the proportion married, and where the sexes are very unequal in number that it is a controlling factor; but where they are not very unequal in number, other influences obscure the effect of the numerical proportion of the sexes.

The largest proportion of husbands is found in Indiana, Georgia, Michigan, Vermont, and South Carolina, all having above 57 per cent of their adult males married. The states with a proportion above the average for the country include every Southern state, except Delaware, Maryland, District of Columbia, Virginia, and Florida; every Northern state east of the Mississippi, except the three in southern New England, with Illinois, and Wisconsin; in the Western North Central, Iowa and Kansas; and in the Western division, New Mexico and Utah.

The smallest proportion of husbands is found, of course, in the states with excess of males, but one may notice that the proportion of husbands in the District of Columbia, notwithstanding the fact that 53.3 per cent of the adult population is female, is less than in any state east of the Rocky mountains, except Minnesota and North Dakota. This may be connected with the urban characteristics of the District of Columbia, but if this were a controlling factor, the next states in order would naturally be those with high proportion of urban population, Rhode Island and Massachusetts. In fact, they rank third and fifth among states east of the Mississippi, Virginia being second and Florida fourth, a fact which indicates that the proportion of urban population and other influences are at work in cooperation.

Widowers are least numerous among adult males in Utah (3.3 per cent), North Dakota (3.4 per cent), Wyoming (3.5 per cent), and Montana (3.6 per cent); they are most numerous in the three northern New England states (6.3 per cent in each).

Among adult females the proportion of single women where they are fewest (New Mexico, 19.8 per cent) is about half that where they are most numerous (District of Columbia, 38.2 per cent). It may be noticed, also, that the proportion of single women where it is greatest (District of Columbia, 38.2 per cent) is about as great as the proportion of single men where it is least (Vermont, 35.1 per cent). Single men are 20 per cent more numerous relatively to the corresponding adult population in Wyoming than single women are in the District of Columbia. Married women are most numerous in Oklahoma, where nearly seven-tenths of the adult women are wives. They are least numerous in the District of Columbia, where less than half (45.2 per cent) are married. Widows like single women are most numerous in the District of Columbia (16.0 per cent) and least so in North Dakota (6.3 per cent), where they are relatively as numerous as widowers in northern New England (6.3 per cent).

In the discussion of marital classes among the total population it was noticed that in the North the per cent single was 4.4 less, and the per cent married 4.3 greater, than in the South, and also that the proportion of children in the South was far greater than in the North. The question whether this excess of children in the South is the sole cause of the large proportion of single in that section is answered by the following table:

[1] Twelfth Census Abstract, Table 38, or Census Bulletin 14, Table v

TABLE XIII.—DISTRIBUTION, BY MARITAL CONDITION, OF ADULT POPULATION CLASSIFIED BY SEX, FOR THE NORTH AND THE SOUTH: 1900.

DIVISION AND SEX.	POPULATION 15 YEARS AND OVER: 1900.										
	Number.						Per cent distribution.				
	Total.	Single.	Married.	Widowed.	Divorced.	Unknown.	Single.	Married.	Widowed.	Divorced.	Unknown.
North Atlantic and North Central divisions	32,259,862	11,588,727	18,012,235	2,454,442	122,626	81,832	35.9	55.8	7.6	0.4	0.3
Male	16,489,625	6,564,838	9,057,417	755,227	54,006	58,137	39.8	54.9	4.6	0.3	0.4
Female	15,770,237	5,023,889	8,954,818	1,699,215	68,620	23,695	31.9	56.8	10.8	0.4	0.1
South Atlantic and South Central divisions	14,754,196	5,136,603	8,276,575	1,243,275	55,039	42,704	34.8	56.1	8.4	0.4	0.3
Male	7,458,771	2,924,895	4,136,136	349,314	19,455	28,971	39.2	55.4	4.7	0.3	0.4
Female	7,295,425	2,211,708	4,140,439	893,961	35,584	13,733	30.3	56.8	12.3	0.4	0.2

The table shows that when children are excluded, and the figures confined to persons 15 years and over, the per cent of single in the North instead of being 4.4 per cent less is 1.1 per cent greater than in the South, and the per cent of married in the North instead of being 4.3 per cent greater is 0.3 per cent less than in the South. In other words, the entire difference between the sections in the per cents of single and of married is due to the very much larger proportion of children in the Southern states, and when children are excluded this difference disappears and is replaced by a contrary difference.

Adults in city and country.—The urban and the rural population may be roughly distinguished, with reference to marital condition, by dividing it according as the persons did or did not live in a place of at least 25,000 inhabitants. On this basis the marital condition of the urban and the rural population is as follows:

TABLE XIV.—*Per cent distribution, by marital condition, of adult population in cities having at least 25,000 inhabitants and in smaller cities or country districts: 1900.*

MARITAL CONDITION.	PER CENT DISTRIBUTION OF POPULATION 15 YEARS AND OVER: 1900.			
			Excess.	
	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.

Divorced	0.4	0.4	.....	.....
Unknown	0.4	0.3	0.1	.....

These figures show that in the city a much smaller proportion of adults are married, and in the country smaller proportions are single and widowed. They agree with and confirm indications already obtained from the rank of the District of Columbia and certain agricultural states, that single life is more common in the city than in the country.

That the sexes are about equal in number in all cities, and that in country districts males largely outnumber females, has already been shown. But those figures applied to all places of at least 2,500 inhabitants, and included children. To determine whether the same difference holds for adults alone and when the division line between city and country is drawn at 25,000, the following per cents have been computed:

TABLE XV.—*Distribution of adult population classified by sex, in cities having at least 25,000 inhabitants and in smaller cities or country districts: 1900.*

	POPULATION 15 YEARS AND OVER: 1900.				
				Per cent.	
	Total.	Male.	Female.	Male.	Female.
Continental United States	49,869,590	25,620,399	24,249,191	51.4	48.6
Cities having at least 25,000 inhabitants	13,901,298	6,904,865	6,996,433	49.7	50.3
Smaller cities or country districts	35,968,292	18,715,534	17,252,758	52.0	48.0

The figures show that there are 6 per 1,000 more females than males among the adults in the cities and 40 per 1,000 more males than females among the adults in the country. Hence, in the cities the distribution of the sexes is more favorable to marriage than in the country. It has already been noticed that nearly three-fourths of the urban population live in the Northern states east of the Mississippi. It may be that if a corresponding analysis is made for the grand divisions of the country, the results will be different in this as they have been in other cases.

To determine the question, the differences between city and country have been computed for each main division.

TABLE XVI.—PER CENT DISTRIBUTION, BY MARITAL CONDITION, OF ADULT POPULATION IN CITIES HAVING AT LEAST 25,000 INHABITANTS AND IN SMALLER CITIES OR COUNTRY DISTRICTS, FOR MAIN GEOGRAPHIC DIVISIONS: 1900.

MARITAL CONDITION.	PER CENT DISTRIBUTION OF POPULATION 15 YEARS AND OVER: 1900.									
	North Atlantic division.		South Atlantic division.		North Central division.		South Central division.		Western division.	
	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Single	38.9	38.7	38.7	35.6	37.9	34.5	38.1	33.4	40.7	39.6

Widowed	8.2	10.8	10.8	7.8	7.5	6.9	11.9	8.2	7.8	6.6
Divorced	0.2	0.3	0.3	0.3	0.5	0.5	0.7	0.4	0.8	0.7
Unknown	0.3	0.4	0.4	0.3	0.3	0.2	0.5	0.2	1.4	0.5

The foregoing figures show that the proportion of single among adults is greater in the city than in the country in each one of the five main divisions of continental United States, and the proportion of married less in each one, except the North Atlantic division. They show, also, that in the proportion of single the city does not differ widely in the several groups—only from a minimum of 37.9 to a maximum of 40.7. The proportion of married is high in northern cities and low in southern and western cities. The proportion of widowed, on the contrary, is low in northern and western cities and high in southern.

In the following table the per cent of single, married, and widowed in the adult population is given for every city having at least 25,000 inhabitants in 1900:

TABLE XVII.—PER CENT DISTRIBUTION, BY MARITAL CONDITION, OF ADULT POPULATION IN CITIES HAVING AT LEAST 25,000 INHABITANTS, ARRANGED ACCORDING TO SIZE UNDER STATES IN GEOGRAPHIC ORDER: 1900.

There is only one city—Seattle—among the 160 in which more than half the adult population were single. At the other extreme there are six—Camden, N. J., Kansas City, Kans., Grand Rapids, Mich., Jacksonville, Fla., Joplin, Mo., and Topeka, Kans.—in which less than one-third were single. The married were most numerous in Kansas City, Kans. (60.0 per cent), which suggests that it may deserve to be called the city of homes. They were least numerous in Richmond (44.8 per cent), Troy (43.8 per cent), and Seattle (42.2 per cent). The table shows that the proportion of married adults in southern cities was usually low. Of 29 southern cities having at least 25,000 inhabitants, 15 had less than one-half of their adult population married, while of the 131 such cities in other parts of the country, only 20 had less than half of their adult population married. The difference is brought out clearly in the following figures:

TABLE XVIII.—*Per cent distribution, by marital condition, of adult population in cities having at least 25,000 inhabitants and in smaller cities or country districts, for the North and West and the South: 1900.*

DIVISION.	PER CENT DISTRIBUTION OF POPULATION 15 YEARS AND OVER: 1900.					
	In cities having at least 25,000 inhabitants.			In smaller cities or country districts.		
	Single and unknown.	Married.	Widowed and divorced.	Single and unknown.	Married.	Widowed and divorced.
Continental United States	39.0	52.2	8.8	35.0	57.0	8.0
The North and West	39.0	52.7	8.3	35.3	57.0	7.7
The South	38.9	49.3	11.8	34.6	57.0	8.4

The table shows that among adults outside of cities having at least 25,000 inhabitants the per cent married in the South was exactly the same as in the North and

West, but within such cities the per cent of adults who were married in the North and West was 52.7, and in the South only 49.3. In other words, among 1,000 adult residents of southern cities the average number married was 34 less than among 1,000 adult residents of northern and western cities, a fact which may be connected with the lower rate of increase of population of such southern cities already referred to in the section Increase of Population. The 29 southern cities each having at least 25,000 inhabitants had an average increase, 1890 to 1900, of 22.5 per cent; the 131 northern and western cities each having at least 25,000 inhabitants had an average increase, in the same decade, of 34.1 per cent.

Age.—Marital condition depends largely upon age. At birth and through childhood and early youth every one is single; of those who attain adult years the great majority marry, and of these marriages the great majority are broken by the death of one party before the other. Single life at first in every case, followed for the large majority by marriage, and for about half of these by a final stage of widowhood ending with death—such is the normal succession of marital conditions in the experiences of the individual. Under these circumstances it is necessary to study marital condition with constant reference to the age of the parties. The gradual passage from the class of single to that of married, and thence to that of widowed, is made apparent by the following figures, in which, for the sake of simplicity, the unknown have been combined with the single and the divorced with the widowed:

TABLE XIX.—*Per cent distribution, by marital condition, of adult population classified by age periods: 1900.*[1]

AGE PERIOD.	PER CENT DISTRIBUTION OF POPULATION 15 YEARS AND OVER: 1900.		
	Single and unknown.	Married.	Widowed and divorced.
Continental United States:			
15 to 19 years	93.8	6.0	0.2
20 to 24 years	64.7	34.2	1.1
25 to 29 years	37.0	60.6	2.4
30 to 34 years	22.6	73.7	3.7
35 to 44 years	14.3	79.2	6.5
45 to 54 years	9.2	78.3	12.5
55 to 64 years	7.3	70.4	22.3
65 years and over	6.1	50.8	43.1

[1] The figures on which these per cents are based may be found in Twelfth Census Abstract, Tables 24 and 25.

The table shows that of those who reach old age about 15 out of 16 are or have been married, and that the proportion of widowed is then not much less than the proportion of married. The proportion of single, beginning at 93.8 per cent, sinks steadily to the end of life. Whether this is due merely to the occasional marriage of an aged bachelor or spinster, or also to the alleged longer life of married persons, can not be shown from the figures.

In the following table the per cents of single, married, and widowed are given for each age group and for each of the five main divisions:

TABLE XX.—PER CENT DISTRIBUTION, BY MARITAL CONDITION, OF ADULT POPULATION CLASSIFIED BY AGE PERIODS, FOR MAIN GEOGRAPHIC DIVISIONS: 1900.

AGE PERIOD.	PER CENT DISTRIBUTION OF POPULATION 15 YEARS AND OVER: 1900.														
	North Atlantic division			South Atlantic division.			North Central division.			South Central division.			Western division.		
	Single and unknown.	Married.	Widowed and divorced.	Single and unknown.	Married.	Widowed and divorced.	Single and unknown.	Married.	Widowed and divorced.	Single and unknown.	Married.	Widowed and divorced.	Single and unknown.	Married.	Widowed and divorced.
15 to 19 years	96.2	3.8	[1]	92.1	7.7	0.2	95.2	4.7	0.1	89.9	9.7	0.4	94.1	5.8	0.1
20 to 24 years	71.2	28.3	0.5	58.2	40.3	1.5	67.7	31.6	0.7	53.3	44.2	2.5	69.9	29.2	0.9
25 to 29 years	42.2	56.3	1.5	31.4	65.4	3.2	38.0	60.1	1.9	27.0	68.5	4.5	46.3	51.5	2.2
30 to 34 years	25.5	71.5	3.0	19.2	75.9	4.9	22.0	74.9	3.1	16.0	78.0	6.0	31.7	64.7	3.6
35 to 44 years	16.8	77.3	5.9	12.4	79.5	8.1	13.0	81.5	5.5	9.9	81.0	9.1	23.2	70.5	6.3
45 to 54 years	11.2	76.2	12.6	8.7	77.6	13.7	7.7	81.5	10.8	6.4	78.7	14.9	17.1	70.7	12.2
55 to 64 years	8.8	68.1	23.1	7.8	68.5	23.7	5.5	74.5	20.0	5.4	69.2	25.4	14.0	64.3	21.7
65 years and over	7.4	47.5	45.1	7.3	49.5	43.2	4.3	54.5	41.2	4.9	50.3	44.8	11.8	49.5	38.7

[1] Less than one tenth of 1 per cent.

The table shows at once noteworthy differences between the different parts of the country. At all ages above 25 to 29, inclusive, single life is much the most common in the Western division, but between 15 and 24 it is most common in the North Atlantic group. It is least common in the South Central at all ages between 15 and 65. Married life all through the early adult years, 15 to 34, inclusive, is most general in the South Central division, but from 35 to the end of life it is most general in the North Central. It is least general in the North Atlantic group during the early years, 15 to 24, and the latest, 65 and over, but during the long intervening period, 25 to 64, it is least prevalent in the Western division. Widowhood, between 15 and 34 years of age, is least common in the North Atlantic group, probably in part because the small proportion

of early marriages there leaves fewer unions exposed to the chance of rupture by death. Between 35 and 64 years it is least common in the North Central division, and in later years it is least common in the Western division. At every age period up to 65 it is most common in the South Central division.

The table brings to light an important difference between North and South, which was obscured by the previous figures for all persons and for all adults. Previous figures for all persons showed that in the North the per cent single was 4.4 less and the per cent married 4.3 greater than in the South. Those for all persons at least 15 years of age showed that in the North the per cent single is 1.1 greater, the per cent married 0.3 less, and the per cent widowed 0.8 less than in the South. The more accurate comparison between the North and South, made possible by Table XX, shows that at every age period the proportion of married in the South Atlantic states is greater than it is in the North Atlantic, and that the difference between the two sections is most marked during the years of early life, when the majority of children are born. In the North Central division, up to 34 years of age, the proportion married is less than it is in the South Central, and up to 30 years of age the difference is very marked. In the later ages the proportion married in the North Central is slightly greater than it is in the South Central. The much larger proportion of married couples, particularly young married couples, in the Southern states is well shown by computing for each of the five main divisions the per cent that the married women under 35 years of age—that is, approximately the age at which women are most likely to bear children—bear to all married women. The following figures give the results:

TABLE XXI.—*Total married women and number and per cent under 35 years of age, for main geographic divisions: 1900.*

DIVISION.	Total married women.	MARRIED WOMEN UNDER 35 YEARS OF AGE: 1900.	
		Number.	Per cent of total married women.
Continental United States	13,813,787	6,426,763	46.5
North Atlantic	4,002,570	1,711,953	42.8
North Central	4,953,262	2,192,319	44.3
Western	714,973	335,691	47.0
South Atlantic	1,758,768	891,147	50.7
South Central	2,384,214	1,295,653	54.3

The proportion of young wives in the North is much less and in the South much greater than the average for the United States. This difference is probably closely connected with the larger proportion of children in the South, and with the rapid increase in its population.

But it must be remembered that these figures apply to all races, and to city and country population. Whether the proportion of married persons among southern whites is as much greater than the proportion in the North, as the foregoing figures would suggest, can not be determined until the analysis by race is considered. This point, therefore, is reserved for subsequent examination. But the larger proportion of married and of young married persons may be due entirely, as it doubtless is in part, to the fact that the southern population is mainly rural and the northern largely urban. To determine this the city population of the two sections and the country population of the two sections should be compared separately.

City and country.—The tabulations of the Twelfth Census report marital condition by age only for cities having at least 100,000 inhabitants and for states and territories. If a distinction is to be drawn between urban and rural and the age classification retained, it is evident that all cities of less than 100,000 inhabitants must be classed with the rural population. This is less misleading than might appear at first glance, because the population of all cities having between 2,500 and 100,000 inhabitants is only about one-fourth of the entire population living outside of cities having at least 100,000 inhabitants. The comparison between two population groups, one exclusively urban and the other three-fourths rural, ought to give an approximate measure of the influence of urban and rural conditions upon marriage. The results of such a tabulation appear in the following table:

TABLE XXII.—*Per cent distribution, by marital condition, of adult population classified by age periods, in cities having at least 100,000 inhabitants and in smaller cities or country districts: 1900.*

AGE PERIOD.	PER CENT DISTRIBUTION OF POPULATION 15 YEARS AND OVER: 1900.					
	In cities having at least 100,000 inhabitants.			In smaller cities or country districts.		
	Single and unknown.	Married.	Widowed and divorced.	Single and unknown.	Married.	Widowed and divorced.
Continental United States:

20 to 24 years	72.6	26.7	0.7	62.7	36.0	1.3
25 to 29 years	43.9	54.0	2.1	35.0	62.5	2.5
30 to 34 years	27.1	69.1	3.8	21.1	75.2	3.7
35 to 44 years	17.6	75.0	7.4	13.3	80.4	6.3
45 to 54 years	11.4	72.8	15.8	8.8	79.6	11.6
55 to 64 years	8.7	63.2	28.1	7.0	71.9	21.1
65 years and over	7.4	42.7	49.9	5.9	52.2	41.9

The preceding table shows that the proportion of single is greater and the proportion of married is less in large cities than it is in the rest of the country. With reference to the widowed, the proportion from 15 to 30 years of age is greater in the country, but at later years it is greater in cities.

It is probably impossible to demonstrate that sexual vice is more prevalent in large cities than it is in smaller cities or country districts. It is undeniably more conspicuous, and this has sometimes led to the unwarranted inference that it is more prevalent. But the foregoing figures, showing the much smaller proportion of married persons in large cities, especially in the earlier years of adult life, would support the belief that where married life is so much less prevalent the unlawful indulgence of sexual desires is probably more prevalent. Indeed, they constitute the most important evidence of a statistical character known to the writer, that concubinage and prostitution are probably more prevalent in the urban than in the rural communities of the United States. The inference from the figures derives some support from the proportion of children to 1,000 women, which is stated and interpreted in another section (page 418).

The inference from the foregoing figures, that the proportion of unmarried adults and especially of young adults in large cities is much greater than in the rest of the country, might be challenged on the ground that such cities lie mainly in the North and East, where marriage and especially early marriage, as has already been shown, is much less prevalent than in the South and West. What seems from the figures to be a difference between city and country may be merely a difference between East and West or North and South. The objection has force. Apparently the best way to meet it is to select certain states and make tables similar to that already given for the country. The states must be representative, and for this reason chosen from different parts of the country; must contain at least one city of 100,000 inhabitants, and the rest of the population must be as largely rural as possible. These requirements seem to be met by New York, containing four cities of 100,000 inhabitants; Vermont, as an adjacent rural state with the most largely rural population of any state in the North Atlantic division; Illinois, which has only one really large city; Missouri, which has three cities of 100,000 inhabitants and no other of above 30,000; Louisiana, which has one large city and no other above 20,000; and California, which has two cities of 100,000. This gives a representation for each of the five divisions, except the South Atlantic, where neither of the two cities of 100,000, Baltimore and Washington, seems typical of average urban conditions in that section. The results appear in the following table:

TABLE XXIII.—*Per cent distribution, by marital condition, of adult population classified by age periods, in cities having at least 100,000 inhabitants and in smaller cities or country districts, for Vermont, New York, Illinois, Missouri, Louisiana, and California: 1900.*

AGE PERIOD.	PER CENT DISTRIBUTION OF POPULATION 15 YEARS AND OVER: 1900.					
	In cities having at least 100,000 inhabitants.			In smaller cities or country districts.		
	Single and unknown.	Married.	Widowed and divorced.	Single and unknown.	Married.	Widowed and divorced.
Vermont:

[1] Less than one-tenth of 1 per cent.

Marriages under 20 years of age are twice as common in Vermont as in the large cities of New York state, while the rest of New York state occupies an intermediate position. A difference of the same sort appears between city and country in every other state, but it is not always of the same amount. Early marriages are more common in New Orleans and the large cities of Missouri than in the large cities of any other states included in the table, but they are much more common outside the large cities of Missouri and Louisiana than within them. At the next age period, 20 to 24 years, similar but less marked differences between city and

country appear. The proportion married is greater in New Orleans than in any other city or group of cities represented, but far greater in the rest of Louisiana than in New Orleans. In every case the per cent married is noticeably higher in the rest of the country than in the large cities. Similar differences appear at every age period. Thus the evidence that married life at all ages is more prevalent outside of the large cities than within them in all parts of the country, is complete and conclusive. It might appear that single life would follow the reciprocal rule with equal uniformity and be always more usual in large cities than elsewhere, but the figures show one exception to this. In California, at ages above 35, single life is more prevalent outside of the large cities than within them and the difference is greater at the highest ages. This is probably a result of the great excess of males in that state until recent years, and the greater disproportion in the numbers of the sexes outside of the large cities than within them. It must be remembered that the figures from which these per cents are derived include all races. The Mongolian population of California may be a factor.

The widowed at all ages above 30, and in many cases at earlier ages, are much more numerous in the city than in the country. As marriages are more numerous in the country, the unions to be broken by death are more numerous and one might expect to find more widowed in the country. The most obvious explanation that the death rate in the country is lower and fewer unions therefore broken by death may account for part of the difference. But probably a more potent cause is the fact that the family, involving both husband and wife, is a unit for life and work of more fundamental necessity in the country than in the city. For this reason, remarriage after the death of husband or wife is probably more common in agricultural than in urban communities. On this theory the smaller proportion of widowed in the country would be due to the shorter average duration of widowhood before remarriage rather than to the smaller proportion of unions broken by death. Another influence also may be at work. Urban population is undoubtedly more mobile than rural, and probably more husbands desert their wives or wives their husbands in the city than in the country. Among such separated couples probably some are erroneously returned as widowed, and this would conduce to swell the number of widowed in large cities.

The general conclusion seems warranted by the evidence, that in all parts of the United States married life in the country districts begins earlier, perhaps lasts longer before being broken by separation, divorce, or death, and if thus broken, is more likely to be succeeded by a new union than in large cities. Family life is thus the more general and dominant form of social organization in the country than in the city, and this is probably due to the fact that the family is a more natural and indispensable economic and industrial unit for social organization in the country than in the city.

Sex and age.—It is a physiological fact that women reach adult years earlier than men. How far the well-known fact that young women, on the average, marry earlier than young men is due to this fact and how far to economic and social differences, compelling the man, as usually the main, and often the only, breadwinner for the family, to delay his marriage, can not be determined from the figures in hand. But these differences, in the effect of age upon the marital tendencies of the two sexes, make it important to combine sex with age in our study. The results of such a study are contained in the following table:

TABLE XXIV.—*Per cent distribution, by marital condition, of male and female adult population classified by age periods: 1900.*[1]

AGE PERIOD.	PER CENT DISTRIBUTION OF POPULATION 15 YEARS AND OVER: 1900.					
	Male.			Female.		
	Single and unknown.	Married.	Widowed and divorced.	Single and unknown.	Married.	Widowed and divorced.
Continental United States:						
15 to 19 years	99.0	1.0	(2)	88.8	10.9	0.3
20 to 24 years	77.9	21.6	0.5	51.7	46.5	1.8
25 to 29 years	46.1	52.5	1.4	27.6	68.9	3.5
30 to 34 years	27.8	69.8	2.4	16.7	78.0	5.3
35 to 44 years	17.1	78.8	4.1	11.2	79.5	9.3
45 to 54 years	10.4	82.2	7.4	7.9	73.9	18.2
55 to 64 years	7.8	79.7	12.5	6.7	60.5	32.8
65 years and over	6.0	67.1	26.9	6.2	34.2	59.6

[1] The figures on which these per cents are based may be found in Twelfth Census Abstract, Tables 24 and 25.
[2] Less than one-tenth of 1 per cent.

The table shows that about one-ninth of the girls between 15 and 20 years of age are married, while only one boy in one hundred at that age is married. There is a noteworthy agreement between the proportion of women married at any age and the proportion of men married at the next higher age. At the highest age period there are two more spinsters than bachelors in a thousand. There is no age period in which five-sixths of either sex are married, the maximum being 82.2 per cent for men 45 to 54 years of age. The maximum prevalence of married life among women is at the ages of 35 to 44, when nearly four-fifths are married. After that age wives become widows more often than spinsters become wives, and the proportion of wives declines in consequence among all women until above 65 years of age three-fifths are widows and only one-third wives.

Sex and age in city and country.—It has already been shown that at every age the proportion of married in the large cities is much less than in the smaller cities or country districts. The question whether this is equally true of both sexes was not answered by the figures heretofore presented. An answer to it will be found in the following figures:

TABLE XXV.—*Per cent married of male and female population 15 years and over, classified by age periods, in cities having at least 100,000 inhabitants and in smaller cities or country districts: 1900.*

AGE PERIOD.	PER CENT MARRIED OF POPULATION 15 YEARS AND OVER: 1900.					
	Male.			Female.		
	In cities having at least 100,000 inhabitants.	In smaller cities or country districts.	Excess married in country.	In cities having at least 100,000 inhabitants.	In smaller cities or country districts.	Excess married in country.
Continental United States:						
15 years and over	52.7	54.9	2.2	51.5	58.3	6.8
15 to 19 years	0.4	1.1	0.7	5.7	12.0	6.3
20 to 24 years	16.2	22.8	6.6	35.8	49.4	13.6
25 to 29 years	46.6	54.2	7.6	61.1	71.3	10.2
30 to 34 years	66.0	71.0	5.0	72.4	79.8	7.4
35 to 44 years	76.2	79.6	3.4	73.6	81.3	7.7
45 to 54 years	79.8	82.7	2.9	65.4	76.0	10.6
55 to 64 years	77.0	80.3	3.3	50.0	62.8	12.8
65 years and over	62.6	67.8	5.2	26.6	35.7	9.1
Age unknown	15.8	31.7	15.9	27.0	42.7	15.7

The foregoing figures show that for each sex and at every age the proportion of married persons in large cities is much less than in the rest of the country. They show also that at every age the effect of city life in this respect is greater upon females than upon males. This difference between the sexes may be summarily but less accurately indicated by regarding only the figures for all adults. Among all males at least 15 years of age in the large cities 52.7 per cent were married and in the rest of the country 54.9 per cent; that is, the number of married men per 1,000 was 22 less in the large cities than elsewhere. Among all adult females, on the other hand, in the large cities 51.5 per cent were married and in the rest of the country 58.3 per cent; that is, the number of married women per 1,000 was 68 less in the large cities than outside them. This is doubtless due in large measure to the excess of females in large cities and of males in the country. The influence of city life is strongest during the early adult years, the figures suggesting that part of those residents of cities who forego marriage between 20 and 30 years of age marry later in life, but that many of them do not marry at all.

One may conclude that the influence of city life is to delay or prevent marriage; that its influence in the case of men is antagonized and in the case of women reenforced by the excess of women in the cities and of men in the country; and that, in consequence, a smaller proportion of each sex at each age are married in the large cities than outside them, but that this difference between city and country among women is fully twice as great as among men.

POPULATION BY RACE.

Total population by race.—The census returns distinguish four races in the population of continental United States—white, negro, Indian, and Mongolian—and give the figures of marital condition for each. The proportions are shown in the following table, the unknown being combined with the single and the divorced with the widowed:

TABLE XXVI.—*Per cent distribution, by marital condition, of total population classified by race: 1900.*[1]

RACE.	PER CENT DISTRIBUTION OF POPULATION: 1900.		
	Single and unknown.	Married.	Widowed and divorced.
Continental United States	58.1	36.5	5.4
White	57.7	37.1	5.2
Negro	60.7	32.5	6.8
Indian	56.7	35.9	7.4
Mongolian	64.9	33.6	1.5

[1] The figures on which these per cents are based may be found in Twelfth Census, Vol. II, Table XLIII.

The figures for the Mongolians are of little significance, because of the very abnormal sex and age composition of that race in the United States. The white race has a larger proportion of married persons than any of the other three; it has a smaller proportion of widowed than either negroes or Indians, and a smaller proportion of single than either negroes or Mongolians. It is characterized, therefore, by a large proportion of married and small proportions of single and widowed.

The following figures introduce the sex distribution for the population, classified by race:

TABLE XXVII.—*Per cent distribution, by marital condition, of male and female population classified by race: 1900.*[1]

RACE.	PER CENT DISTRIBUTION OF POPULATION: 1900.					
	Male.			Female.		
	Single and unknown.	Married.	Widowed and divorced.	Single and unknown.	Married.	Widowed and divorced.
Continental United States	60.8	36.0	3.2	55.2	37.2	7.6
White	60.4	36.4	3.2	54.9	37.8	7.3
Negro	63.8	32.4	3.8	57.7	32.5	9.8
Indian	61.1	34.4	4.5	63.6	32.2	4.2
Mongolian	65.7	33.0	1.3	48.2	46.6	5.2

[1] The figures on which these per cents are based may be found in Twelfth Census, Vol. II, Table XLIII.

The figures show that white males have fewer single and more married than either of the other three races and fewer widowers than the negroes or Indians. They show, also, that white females have fewer single and more married than either negroes or Indians, but that the proportion of white widows is less than that of negroes but greater than that of Indians.

Inferences from this table, however, are open to the objection that the proportion of children is widely different in the four races. This appears clearly from the following figures:[1]

RACE.	Population under 15 years of age in 10,000 total population: 1900.
Continental United States	3,438
White	3,370
Negro	3,974
Indian	3,947
Mongolian	302

Almost exactly one-third of the white race is less than 15 years of age; for negroes and Indians the proportion is nearly two-fifths; for Mongolians it is less than one-thirtieth. These figures show the necessity of excluding children, as is done in the following table:

[1] From Twelfth Census Abstract, Table 11.

TABLE XXVIII.—*Per cent distribution, by marital condition, of male and female adult population classified by race: 1900.*[1]

RACE.	PER CENT DISTRIBUTION OF POPULATION 15 YEARS AND OVER: 1900.					
	Male.			Female.		
	Single and unknown	Married.	Widowed and divorced.	Single and unknown.	Married.	Widowed and divorced.
Continental United States	40.6	54.5	4.9	31.4	56.9	11.7
White	40.6	54.6	4.8	31.6	57.3	11.1
Negro	39.8	54.0	6.2	30.1	53.7	16.2
Indian	35.5	57.0	7.5	21.4	61.4	17.2
Mongolian	65.1	33.6	1.3	29.7	63.2	7.1

[1] The figures on which these per cents are based may be found in Twelfth Census, Vol. II, Table XLIV.

As soon as the children are excluded the indications of the preceding figures are reversed. The last table shows that among adults of both sexes the whites have more single than the negroes or the Indians. They have also fewer widowers and widows. White husbands and wives are relatively more numerous than negro husbands and wives, but less numerous than Indian husbands and wives.

Adult population by race, sex, and age.—Yet another basis of classification, that by age, must be introduced in analyzing the differences of marital condition in the four races. That has been done in the following table:

TABLE XXIX.—PER CENT DISTRIBUTION, BY MARITAL CONDITION, OF MALE AND FEMALE ADULT POPULATION CLASSIFIED BY AGE PERIODS AND RACE: 1900.[1]

SEX AND AGE PERIOD.	PER CENT DISTRIBUTION OF POPULATION 15 YEARS AND OVER: 1900.											
	White.			Negro.			Indian.[2]			Mongolian.[2]		
	Single and unknown.	Married.	Widowed and divorced.	Single and unknown.	Married.	Widowed and divorced.	Single and unknown.	Married.	Widowed and divorced.	Single and unknown.	Married.	Widowed and divorced.

[1] The figures on which these per cents are based may be found in Twelfth Census, Abstract, Tables 24 and 25, and Vol. II, Table 29.
[2] Figures are for continental United States, Alaska, Hawaii, and military and naval.
[3] Less than one-tenth of 1 per cent.
[4] Per cent not shown where base is less than 100.

Noticing first the male population and disregarding the figures for the Mongolians on the ground of their abnormal character, it will be seen from the table that marriages of negro boys before they are 20 are about twice as common as of white boys at the corresponding age, and marriages of Indian boys are twice as common as of negroes, or four times as common as of whites. Of white men between 20 and 24 years of age, about one-fifth are married, but of negroes and Indians, one-third are married. At the next age period, 25 to 29, the proportion of white husbands rises to one-half and that of negro and Indian husbands to about two-thirds of the population. At the ages of 30 to 34 the white husbands are about seven-tenths of the popula-

tion, and the negro and Indian husbands about three-fourths. At 35 to 44 years the proportion of white and negro husbands is the same, about four-fifths of the population, the Indian married men being relatively still a little more numerous. Substantially the same relation subsists between the races after 44 years of age.

The general inference appears to be that white men marry much later in life than negroes and Indians, but that after the age of 35 is reached, the difference between the marital tendencies of the three races is insignificant. It is noteworthy, also, that among negroes and Indians at all ages the proportion of widowers is much greater than it is among the whites. This may probably be connected both with the greater frequency of early marriages, creating a larger number of unions exposed to termination by death, and with the lower vitality of the negro and Indian races, which doubtless results in a larger proportionate number of deaths among negro and Indian wives. It may also indicate less accurate returns or less permanent unions. Probably some husbands who have deserted their wives are returned as widowers, and probably such cases are more common among negroes and Indians than among whites.

Turning to the proportions for females, it appears that marriages among girls under 20 years of age are about one and one-half times as common among negroes and two and one-half times as common among Indians as among whites. At the ages of 20 to 24 less than half of the white women, more than half of the negro women, and nearly two-thirds of the Indian women are wives; at the ages of 25 to 29 about seven-tenths of the white and negro women and more than eight-tenths of the Indian women. At the next age period, 30 to 34, the proportion of white wives is midway between the proportion for the other two races, exceeding that for the negroes about as much as it falls short of that for the Indians. At the next age period, 35 to 44, the difference between the white and the Indian races decreases, and from 45 years of age the proportion of white wives is greater than that in either of the other races.

The facts that Mongolian men at almost every age have the largest proportion of single and the smallest proportion of married and widowed, while Mongolian women with almost equal uniformity have the smallest proportion of single and widowed and the largest proportion of married, are a noteworthy illustration of the effect of a wide disparity in the numbers of the two sexes upon the figures of marital condition. However different Mongolian standards in marital life may be from Caucasian, it is clear that the Mongolian population of the United States can no more be deemed representative of the Mongolian population of Asia, in this respect, than the Caucasian population of Alaska in its marital condition can be deemed representative of the Caucasian population of the United States.

Early marriages are evidently much more common among negroes and Indians than among whites, and the difference between the races is far greater in the case of males than in the case of females. But it has already been noticed that early marriages are much more common in the South than in the North. In order to ascertain how far this apparent difference between the races is geographical rather than racial, figures similar to the foregoing have been computed for the whites and the negroes of the Northern and Southern states. Results appear in the following table:

TABLE XXX.—PER CENT DISTRIBUTION, BY MARITAL CONDITION, OF MALE AND FEMALE POPULATION 15 YEARS AND OVER, CLASSIFIED BY AGE PERIODS AND RACE, FOR THE NORTH AND THE SOUTH: 1900.

[1] Less than one-tenth of 1 per cent.

In the North marriages of negroes of either sex less than 25 years of age are more common than marriages of whites. In the South the same is true but the difference for negro men persists to the age of 35.

PROPORTION OF CHILDREN.

SUMMARY OF RESULTS.

No census can furnish all the information needed to compute the birth rate or number of births in a year to each thousand persons, nor has this information been obtained for the United States, or any considerable part of it, by any other agency. The attempts to approximate the birth rate on the basis of census figures have been far from satisfactory. As a result the birth rate in the United States, past or present, is unknown.

The ratio of the living children under 5 years of age to each 1,000 living women of child-bearing age is used as the best available substitute for the birth rate during the last half of the nineteenth century.

The proportion of children under 10 years of age to the total population can be ascertained for a longer period. It has decreased almost uninterruptedly since the early part of the century, the number of such children constituting approximately one-third of the total population at the beginning of the century and less than one-fourth at the end.

The decrease in the corresponding proportion for whites began as early as 1810 and continued uninterruptedly to the end of the century.

Since 1830, when the figures were first obtained, the proportion of negro children under 10 years of age to the total negro population has decreased. There was, however, an increase from 1860 to 1880. On the other hand there was a rapid decrease from 1880 to 1900.

The proportion of white children under 5 years of age to the total population decreased steadily, except from 1850 to 1860, the number of such children being in 1900 about three-fifths of what it was in 1830. The decrease during the last decade of the century was insignificant.

The corresponding proportion for negroes was at its height in 1850 and 1880 and except for 1870 was least in 1900.

The decades of great immigration and the Civil War showed the greatest ratio of decrease in the proportion of children.

The decades immediately following those of great immigration showed a reduction in the rate of decrease, probably because of the high birth rate among the immigrants. The reduction in the proportion of children to total population during the century suggests but does not prove that the birth rate was lower.

The increase in the proportion of children among negroes from 1860 to 1880 and the decrease from 1880 to 1900 suggests a high birth rate during the twenty years following emancipation and a rapid fall in the birth rate thereafter.

The proportion of children under 5 years of age to women of child-bearing age increased from 1850 to 1860 but has decreased since then, being in 1900 about three-fourths of what it was in 1860.

The decline in the proportion of children since 1860 has been less marked in the South than in the North and West. The proportion in the North and West in 1850 was about five-sixths and in 1900 less than three-fourths of that in the South.

In 1900 the maximum proportion of children was in North Dakota and Indian Territory, where children under 5 years of age were about two-thirds of the number of women. In 1890 the maximum was in North Dakota and Idaho.

In 1900 the minimum number of children was in the District of Columbia and California, being about one-third of the number of women. In 1890 it was in the District of Columbia and New Hampshire.

In 1900 there was a band of states from Maine to California in which the proportion of children was below 500 to 1,000 women. This band was broken by Utah, where the influence of the Mormon church was felt. Except for Kansas the proportion for these states was below that for continental United States.

In 1890 the regions in which the number of children was less than one-half the number of women were separated.

In the North Atlantic states, and in Virginia, West Virginia, North Carolina, Oklahoma, Montana, New Mexico, and Nevada the proportion of children increased between 1890 and 1900. The increase in the North Atlantic division was probably due to the high birth rate among the immigrants that entered from 1880 to 1890.

In Maryland, Kentucky, Michigan, Ohio, Illinois, and Indiana the proportion of children has decreased steadily since 1850.

The decrease for the country during the past decade was due in the main to the controlling influence of the states west of the Alleghenies.

From 1850 to 1880 the low proportion of children in New England and the high proportion in some of the Western states, especially those under Mormon influence, were striking.

The proportion of white children was high in the South, showing that the proportion for negro children was not the controlling factor in the proportion for the total population.

In many of the states, particularly most of those in the Atlantic divisions, the relative number of white children increased from 1890 to 1900.

The largest proportion of negro children was found in 1880 and the smallest in 1900, being only about three-fourths of that in 1880.

The proportion for negroes was uniformly larger than that for whites.

As compared with whites in the South there was for negroes an excess, reaching a maximum in 1880, at every census except 1900, when there was an excess for whites.

The proportion of children in cities was about two-thirds of what it was in the country in 1900.

In the North there was little difference in the proportion for city and country.

In the South the proportion in cities was hardly more than half as great as that in the country.

In the West the ratio of the proportion for city and country was between the two extremes.

In 1900 the proportion of children in the country was about one-sixth greater for the colored population than that for the white. In cities the proportion of children among the whites was more than one-half larger than that among the colored. It may be that the mortality among negro children in the city is high, as generally the birth rate is higher than for whites.

The proportion of children for each race was low in southern cities.

From 1890 to 1900 the decrease in the proportion of children was much greater for the non-Caucasian than for the white.

DISCUSSION OF METHODS.

The census and the birth rate. The birth rate is a statement of the average number of births in a unit of time, usually a year, occurring in an average unit of population, usually 1,000. The number of people in any given place on a certain date is determined by a census, but to ascertain the birth rate it is needful also to know the total number of births occurring in the year of which the census day is the middle. This number is not given by a census, and hence no census of itself can furnish the information needed to compute a birth rate. Neither is there in the United States nor in any considerable part of it any effective agency for securing this information. As a result, the birth rate of the population of the United States, present or past, is unknown.

The information conveyed by a birth rate is of fundamental importance in the discussion of many economic and social questions. For this reason, in default of direct information regarding the birth rate of the United States, efforts have been made to compute it by indirect methods of approximation and to ascertain whether it is stationary or changing, and if the latter, in what direction and how rapidly. The results of these efforts have been far from satisfactory and convincing. As the present discussion is another attempt to derive from census figures some light upon this difficult question, it may best be introduced by a summary of the state of the evidence and of opinion at the present time.

An article dealing with the subject and published in 1893 was written by Dr. J. S. Billings, easily the first authority on this subject in the United States and the expert in charge of vital statistics for the censuses of 1880 and 1890.[1] The opening paragraphs of the article are as follows:

> The results of the Eleventh Census indicate that the birth rate was decidedly lower, or that the enumeration of children was much more defective in the United States in 1890 than it was in 1880, or that both of these statements are partially correct. We have nowhere in this country an accurate and complete registration of births, and the only way in which we can obtain an approximate estimate for the whole country, or for a state, is, at each decennial census, to take the number of children under 1 year of age found living at the date of the census and add to this the number of children who died during the census year and who were born during the same year.
>
> By this method we find that the birth rate per thousand of population in the United States was 30.95 in 1880 and 26.68 in 1890; that is, it has diminished a little over 4 per thousand.
>
> We know that the figures are not accurate for either census, that a large proportion of the deaths of infants in most of the states are not recorded, and that some of the living infants are either not counted at all or, if they are 10 or 11 months old, they are reported as 1 year old. Nevertheless, as the two censuses were taken in substantially the same way it is usually assumed that the errors of omission are in about the same proportion in each case, and hence that the results are comparable with each other, although not comparable directly with the figures from those countries which have a fairly accurate system of registration of births and deaths.

After a careful review of the available evidence Doctor Billings ended his analysis of the figures thus:

> It appears to me that we are justified in concluding that the birth rate has really diminished in the United States and that the errors in the census of 1890 as regards the number of children present are probably not materially greater than those in the census of 1880, except, perhaps, among the colored people in the Southern states.

Before the Report on Vital Statistics for the Eleventh Census was published the available evidence was probed more thoroughly than had been possible at the earlier date, and the conclusion reached that the alternative rejected in 1893 "that the enumeration

[1] "The Diminishing Birth Rate in the United States," The Forum, vol. 15, pages 467–477 (June, 1893).

of children was much more defective in 1890 than it was in 1880" was probably the true one. The argument in support of this conclusion will be found in full in Eleventh Census, Report on Vital and Social Statistics, Part I, pages 490 to 492, and in expanded form in an article subsequently published.[1] The investigation which led to this result was occupied mainly with a comparison between the number of children under 1 and under 5 years of age found by the Federal censuses in Massachusetts on the first day of June, 1880 and 1890, and the number of survivors who would have been found on those dates had the registration records of the births and deaths of young children during the five years preceding the census been correct and complete.

The fundamental assumption of this method, therefore, was that state registration returns in Massachusetts were more accurate than Federal census returns and might be "used to determine the probable error in the population figures." The conclusion reached by this method was that probably at least 1,000,000 children in the United States under 5 years of age were omitted entirely by the census of 1890. At this stage of the argument, therefore, a radical and seemingly irreconcilable divergence was manifest, one conclusion being that the birth rate in the United States in 1890 was hardly more than six-sevenths of what it was in 1880, the other being that the birth rate in 1890 was actually higher than in 1880.

Subsequent discussion brought out a point which had been previously overlooked. In 1880 the census enumerators asked this question regarding every person in the United States, "Age at last birthday?" and according to the instructions the children under 5 years of age should have included all less than 60 months old; in 1890 the form of the question was changed to "Age at nearest birthday?" and according to the instructions the children under 5 years of age should have included all less than 54 months old.[2] There is no means of deciding how far the instructions on this point were followed in the two enumerations, but internal evidence indicates that the change had some effect on the returns for young children. The conclusion reached after consideration of the possible influence of this change was thus stated:[3]

> It seems, therefore, impossible on the one hand to accept Mr. King's contention that the decrease in the birth rate between 1880 and 1890 was merely apparent and not real, and on the other hand to accept the conclusion of Doctor Billings that the decrease in the birth rate in the United States was greater than in any of the eleven countries in western Europe with which comparison is made. There was probably a sharp and almost universal decrease in the birth rate between 1880 and 1890—a decrease which affected especially the negroes and to a somewhat less degree the Southern whites; but the actual amount of this decrease was less than the apparent amount, owing to the change in the form of the age question, and it is impossible now to determine what proportion of the decrease was actual and what proportion was merely apparent.

Under further analysis another objection to the argument of Mr. King developed. He had assumed that the records of Massachusetts were typical and that the inference from conditions found there to those in the United States was admissible. But a change in the registration laws of that state went into effect February 26, 1880, too late to affect materially the returns for 1879–80, but affecting those for 1889–90. This change seems to have affected the validity of the inferences from the figures for that state for 1880 and 1890.[4]

After careful study of the efforts that have been made, I am reluctantly compelled to agree with the statement in Volume III, page xlix, of the Twelfth Census that the statistics "are entirely inadequate to determine directly the general birth rate of the country." But the discussion seems to have established the following points as highly probable:

1. In appealing to registration records to impeach a census, one is invoking the less careful and complete record against the more careful. The contrary assumption that registration records may and should be corrected by the results of a census seems more reasonable and is supported by foreign experience.

2. The change in the form of the age question in 1890 affected the returns and unduly lowered to an unknown extent the birth rate of 1890 computed by this method.

3. One who contends that wholesale omissions occurred in the enumeration of young children is bound to explain how, under a system requiring the enumerators to visit every house and every family and paying them usually for every name reported, it would be possible to get an approximately complete enumeration of adults and yet a deficiency of "at least 25 or 30 per cent" in the enumeration of children under 1 year of age. No such explanation has been made.

4. The effect of the admitted tendency to overstate the age of very young children must also be considered. Nothing should be ascribed to omissions which can be explained in this simpler way.

5. The presumption that there has been a decrease in the birth rate of the United States, because of the fact that there has been such a decrease in almost every country in western Europe, and because what is known of social and economic conditions in the United States would lead one to expect such a decrease here, must be met and rebutted by those who seek to impeach the obvious meaning of the figures.

---

[1] "The Decrease in the Proportion of Children," by William A. King; Political Science Quarterly, vol. 12, pages 608–621 (December, 1897).

[2] This change was not made in the division of vital statistics, and there is no evidence that the change itself or its possible effect was ever called to the attention of the division. Hence the oversight was not unnatural.

[3] "A Difficulty with American Census Taking," by W. F. Willcox, in Quarterly Journal of Economics, vol. 14, page 466 (August, 1900).

[4] "The Enumeration of Children," by A. A. Young in American Statistical Association Publications, Vol. VII, page 227 (March, 1901).

6. The ultimate test of the claim that many young children are omitted by the census is a careful recount in small selected areas where good registration records have been kept for some years, tracing down every case of discrepancy between the two authorities in the effort to determine their comparative accuracy. The careful recount of about 63,000 persons in Maryland shortly after the Twelfth Census completely failed to confirm the theory that enumerators are more likely to omit young children than any other class of the population. On the contrary, the proportion of children under 1 among the 1,554 omitted was rather less, and the proportion of children under 5 practically the same, as in the general population of Maryland.

Basis for comparison.—Meantime in the present discussion another line of analysis has been followed. The increase of a population aside from immigration depends not merely on the number or proportion of infants annually contributed to recruit or swell the ranks of the population; it depends also on the number successfully reared. The enumeration of children under 5 years of age is admitted by everyone to be far more accurate and complete than the enumeration of children under 1 year of age. The proportion of children is thus an approximately accurate and a significant clue to the amount of new blood that is being brought into the country by nature's processes of reproduction and growth. Even if the enumeration of adults is substantially complete and that of children far from complete, no valid ground has been shown for believing that the per cent of omissions among children differs widely from census to census. Each census is organized more efficiently than the last and gathers its information from a better educated, less suspicious, and more friendly population. Hence such omissions should and probably do tend to become relatively less frequent. In that case the reported number of children would increase from census to census faster than the actual number, and the tendency of such a gradually disappearing error would be to mask rather than to exaggerate the real decline in the proportion of children.

It is a debatable question whether the population with which the number of children is compared should be the total population, the adult population, the women of child-bearing age, or the married women of child-bearing age. Each method has its advantages. The proportion to the total population can be computed for a longer period than any other and hence is better adapted for a preliminary survey of the general trend. But for most purposes a comparison with the number of women of child-bearing age seems the best. The number of married women of child-bearing age is known only for 1890 and 1900. Partly for this reason, partly because many of the influences tending to decrease the birth rate tend also to decrease marriages, and partly because limiting the comparison to married women excludes the influence of illegitimacy, the comparison between children and married women should be used only in a subsidiary way.

PROPORTION OF CHILDREN IN TOTAL POPULATION.

Continental United States.—The number of children under 5 years of age and also the number of women of child-bearing age in the total population have been reported by the censuses only since 1850; the number of children under 10 years of age has been reported for censuses since 1830. Accordingly, an accurate statement of the proportion of children under 10 years of age to the total population can be made for the last seventy years of the nineteenth century. For 1800, 1810, and 1820 the number of free white children under 10 years of age was given and for 1820 the number of free colored and slaves under 14 years of age. From this information an effort has been made to estimate approximately the total number of children under 10 years of age at each of these earlier censuses by aid of the assumption that as the negro population under 14 years of age in 1900 is to the negro population under 10 years of age in 1900, so is the negro population under 14 years of age in 1820 to the negro population under 10 years of age in 1820. For 1800 and 1810 the free colored and slave population under 14 years of age has first been estimated from the total free colored and slaves of all ages by assuming that the proportions of 1820 applied, and then from these estimates the free colored and slave population under 10 years of age has been estimated as in 1820. It is admitted that the results are only approximate, but it must be remembered that these estimates applied to only one-sixth of the entire population under 10, five-sixths of it being given by direct enumeration. The figures are given in the following table:

TABLE I.—*Number and per cent of children under 10 years of age in total population and decrease in per cent during the preceding 10 and 20 years: 1800 to 1900.*

CENSUS.	Total population.	Population under 10 years of age.	Per cent of total population under 10 years of age.	DECREASE IN PER CENT DURING— Preceding ten years.	DECREASE IN PER CENT DURING— Preceding twenty years.
Continental United States:					
1900	75,994,575	18,044,751	23.7	0.6	3.0
1890 [1]	62,622,250	15,208,691	24.3	2.4	2.5
1880	50,155,783	13,394,176	26.7	0.1	2.0
1870	38,558,371	10,329,426	26.8	1.9	2.3
1860	31,443,321	9,013,696	28.7	0.4	3.2
1850	23,191,876	6,739,041	29.1	2.8	3.8
1840	[2] 17,063,353	5,440,593	31.9	1.0	0.8
1830	[3] 12,860,702	4,224,897	32.9	[4] 0.2	0.6
1820	9,638,453	[5] 3,150,638	32.7	0.8	0.8
1810	7,239,881	[5] 2,424,683	33.5	0.0	.....
1800	5,308,483	[5] 1,776,010	33.5	.....	.....

[1] General enumeration.
[2] Exclusive of 6,100 persons in military and naval service.
[3] Exclusive of 5,318 persons in military and naval service.
[4] Increase.
[5] Estimated.

The table shows that at the beginning of the nineteenth century children under 10 years of age constituted one-third and at the end less than one-fourth of the population. A decline in the proportion of children began as early as the decade 1810 to 1820 and continued almost uninterruptedly but by very different amounts until 1900. The average decrease has been about 1 per cent in a decade. The greatest decreases occurred in the decades 1840 to 1850 and 1880 to 1890. This was probably due to the enormous immigration which swelled the adult population with great rapidity. For the decade 1880 to 1890 this factor may have been reenforced by the change in the form of the age question, although the influence of this upon the number of children under 10 is uncertain. The next largest decrease was in the decade from 1860 to 1870, when the direct and indirect effects of the Civil War reduced the proportion of children. But this decrease was accentuated by the serious omissions of that census, especially in the Southern states and among the negroes for whom the proportion of children is very high.

The figures as a whole suggest that there has been an almost uninterrupted but irregular decrease in the birth rate from near the beginning of the nineteenth century. They do not prove this, for the decrease might be explained by the increasing vitality of the population, leading to a longer average duration of life and consequently the survival of a larger number of adults.

PROPORTION OF CHILDREN TO POTENTIAL MOTHERS.

Continental United States.—The method of estimating the proportion of children, by comparing them with the number of women of child-bearing age, may be applied for the period 1850 to 1900. This method has two advantages over the preceding. It makes it possible to limit the children to those under 5 years of age and to exclude from the second term of the comparison all males and the females not of child-bearing age. Under these conditions any decrease in the proportion of children which the figures may show could not be explained as due to the increased vitality and longevity of the adult population. The limits of child-bearing age are usually assumed as 15 and 44, but for the earlier censuses the limits must be taken as 15 and 49. The figures are as follows:

TABLE II.—*Number of children under 5 years of age to each 1,000 females 15 to 49 years of age and decrease in the number during the preceding 10 and 20 years: 1850 to 1900.*

CENSUS.	Number of children under 5 years of age to 1,000 females 15 to 49 years of age.	DECREASE IN NUMBER DURING—	
		Preceding ten years.	Preceding twenty years.
Continental United States:			
1900	474	11	85
1890	485	74	87
1880	559	13	75
1870	572	62	54
1860	634	[1]8	.....
1850	626	.....	.....

[1] Increase.

The proportion of children increased from 1850 to 1860 and then decreased without a break but by very unequal amounts. The last column of the table has been introduced to call attention to the comparatively uniform decrease by twenty-year periods. The slight decrease from 1870 to 1880 was probably due in part to serious omissions in 1870 among the population having a large proportion of children. The slight decrease from 1890 to 1900 was probably due in part to the great prosperity of the country between 1890 and 1900, especially in the last years of the decade, in part to the many children born to the millions of immigrants of the preceding decade, and in part also to the change in the form of the age question.

In 1900 there were only three-fourths as many living children to each 1,000 potential mothers as in 1860. The assumption that there has been a progressive increase in the inaccuracy of the censuses leading to omissions of larger and larger proportions of children is too improbable for serious refutation, and yet no other alternative can be suggested by aid of which to escape the conclusion that the birth rate has declined persistently since 1860.

It is beyond the scope of the present discussion to examine the causes of this decline in the birth rate. But one suggestion, made by the superintendent of the censuses of 1870 and 1880, Gen. F. A. Walker, and supported by statistical evidence, seems to call for mention here. General Walker pointed out[1] that the decline in the rate of increase of the American population (and so the decline in the birth rate) began with

[1] "Immigration and Degradation" in "Discussions in Economics and Statistics," vol. 2, page 422.

the rapid influx of immigrants. The following quotations give the gist of his contention:

As the foreigners began to come in larger numbers, the native population more and more withheld their own increase.

Now, this correspondence might be accounted for in three different ways: (1) It might be said that it was a mere coincidence, no relation of cause and effect existing between the two phenomena. (2) It might be said that the foreigners came because the native population was relatively declining—that is, failing to keep up its pristine rate of increase. (3) It might be said that the growth of the native population was checked by the incoming of the foreign elements in such large numbers. * * *

The true explanation of the remarkable fact we are considering I believe to be the last of the three suggested. The access of foreigners at the time and under the circumstances constituted a shock to the principle of population among the native element. That principle is always acutely sensitive, alike to sentimental and to economic conditions. And it is to be noted, in passing, that not only did the decline in the native element, as a whole, take place in singular correspondence with the excess of foreign arrivals, but it occurred chiefly in just those regions to which the newcomers most freely resorted.

General Walker concludes:

If the foregoing views are true, or contain any considerable degree of truth, foreign immigration into this country has, from the time it first assumed large proportions, amounted not to a reenforcement of our population, but to a replacement of native by foreign stock. That if the foreigners had not come, the native element would long have filled the places the foreigners usurped, I entertain not a doubt.

Whether the evidence warrants the opinion that the decrease in the birth rate is due mainly to immigration of alien stock must be left to the student to decide. But one may mention that the recent decline of the birth rate in Australia has given rise to grave anxiety and led to the appointment in New South Wales of a governmental commission for its investigation. No torrent of alien immigrants has been flooding Australia, and yet the decline of the birth rate has probably been as rapid there as among native American stock.

It may be in place to introduce here for comparison with the opinion and the argument of General Walker the weighty words of Dr. John Shaw Billings. Toward the close of the article already cited, after he had developed conclusions in substantial agreement with those reached by a different method in the preceding analysis, he advanced from a purely statistical discussion to consider the causes of this decline in the American birth rate.

Does this diminution in birth rates indicate a progressive diminution in fertility, in the power of either or both sexes to produce children? There is no good reason for thinking so. It is true that it has been suggested that alcohol, tobacco, and syphilis are producing a deterioration of races which is in part responsible for the change, but of this there is no evidence. So far as we have data with regard to the use of intoxicating liquors, the fertility seems to be greatest in those countries and among those classes where they are most freely used.

Is the lessening birth rate due to changes in the mode of life of the people, such as the progressive increase of migration from the rural districts to the cities, the increase of wealth and luxury, the so-called "emancipation of women," etc.?

No doubt these things have some influence, by diminishing the proportion of marriage at comparatively early ages, and by favoring an increase in divorce and in prostitution, but it is probable that the most important factor in the change is the deliberate and voluntary avoidance or prevention of child bearing on the part of a steadily increasing number of married people, who not only prefer to have but few children, but who know how to obtain their wish. The reasons for this are numerous, but I will mention only three.

The first is the diffusion of information with regard to the subject of generation by means of popular and school treatises on physiology and hygiene, which diffusion began between thirty and forty years ago. Girls of 20 years of age at the present day know much more about anatomy and physiology than did their grandmothers at the same age, and the married women are much better informed as to the means by which the number of children may be limited than were those of thirty years ago. To some extent this may also be true as regards the young men, but I do not think this is an important factor.

The second cause has been the growth of the opinion that the abstaining from having children on the part of a married couple is not only not in itself sinful, or contrary to the usual forms of religious creeds, but that it may even be under certain circumstances commendable.

The third cause is the great increase in the use of things which were formerly considered as luxuries, but which now have become almost necessities. The greater temptations to expenditure for the purpose of securing or maintaining social position, and the correspondingly greater cost of family life in what may be called the lower middle classes, lead to the desire to have fewer children in order that they may be each better provided for, or perhaps, in some cases, from the purely selfish motive of desire to avoid care and trouble and of having more to spend on social pleasures.

In the struggle for what is deemed a desirable mode of existence at the present day, marriage is being held less desirable, and its bonds less sacred, than they were forty years ago. Young women are gradually being imbued with the idea that marriage and motherhood are not to be their chief objects in life, or the sole methods of obtaining subsistence; that they should aim at being independent of possible or actual husbands and should fit themselves to earn their own living in some one of the many ways in which females are beginning to find increasing sources of remunerative employment; that housekeeping is a sort of domestic slavery, and that it is best to remain unmarried until some one offers who has the means to gratify their educated tastes. They desire to take a more active part than women have hitherto done in the management of the affairs of the community, to have wider interests, and to live broader lives than their mothers and grandmothers have done.

It is a strong argument against this theory of the causation of the lowered birth rate for this country, that the greatest diminution in the rate has apparently occurred in the agricultural states, and especially among the colored population in the South. It appears to be probable that this greater diminution in these states is due, to some extent at least, to greater errors in the data from which the rates are calculated, both in the count of the living infants and in the returns of the "born and died during the year." It is also probable that voluntary prevention of conception had been far more common in the Northern and Eastern states for a number of years preceding 1880 than it was in the South, but that after 1880 it has increased in the South, producing a relatively greater effect in reduction of rates, although the absolute rates are still decidedly higher than they are in the New England states.

If this view of the case is correct, the birth rate will not only continue low in the United States as compared with former years, but it will probably become lower. On the other hand, so long as the present tendency of the people to aggregate in cities continues, as it is likely to do until our coal supplies begin to shrink perceptibly, with a corresponding increase in the cost of power for purposes of manufacture and of transportation, so long the death rates are likely to increase, and, therefore, the rate of increase in population due to excess of births over deaths will diminish. * * *

This state of things has occurred before in the world's history in certain regions, as, for instance, in southern and western Europe during the decline of the Roman Empire, and if the increase of population had not been checked, as it then was, the world would now be overcrowded.

It does not appear to me that this lessening of the birth rate is in itself an evil, or that it will be worth while to attempt to increase the birth rate merely for the sake of maintaining a constant increase in population, because to neither this nor the next generation will such increase be specially beneficial. But considered as one of the signs of forces which are at work to modify the existing conditions of society, and some of which appear to be of evil tendency, this diminution of the birth rate merits careful consideration by statisticians, sociologists, politicians, and all who are interested in the physical and moral well-being of the inhabitants of this country.

The evidence that has developed and come to the knowledge of the writer during the twelve years since this article was written has strengthened his belief in the substantial accuracy of the foregoing statement. But in this field the measuring rod of statistics will find little application until the vital statistics of the United States are more perfectly developed.

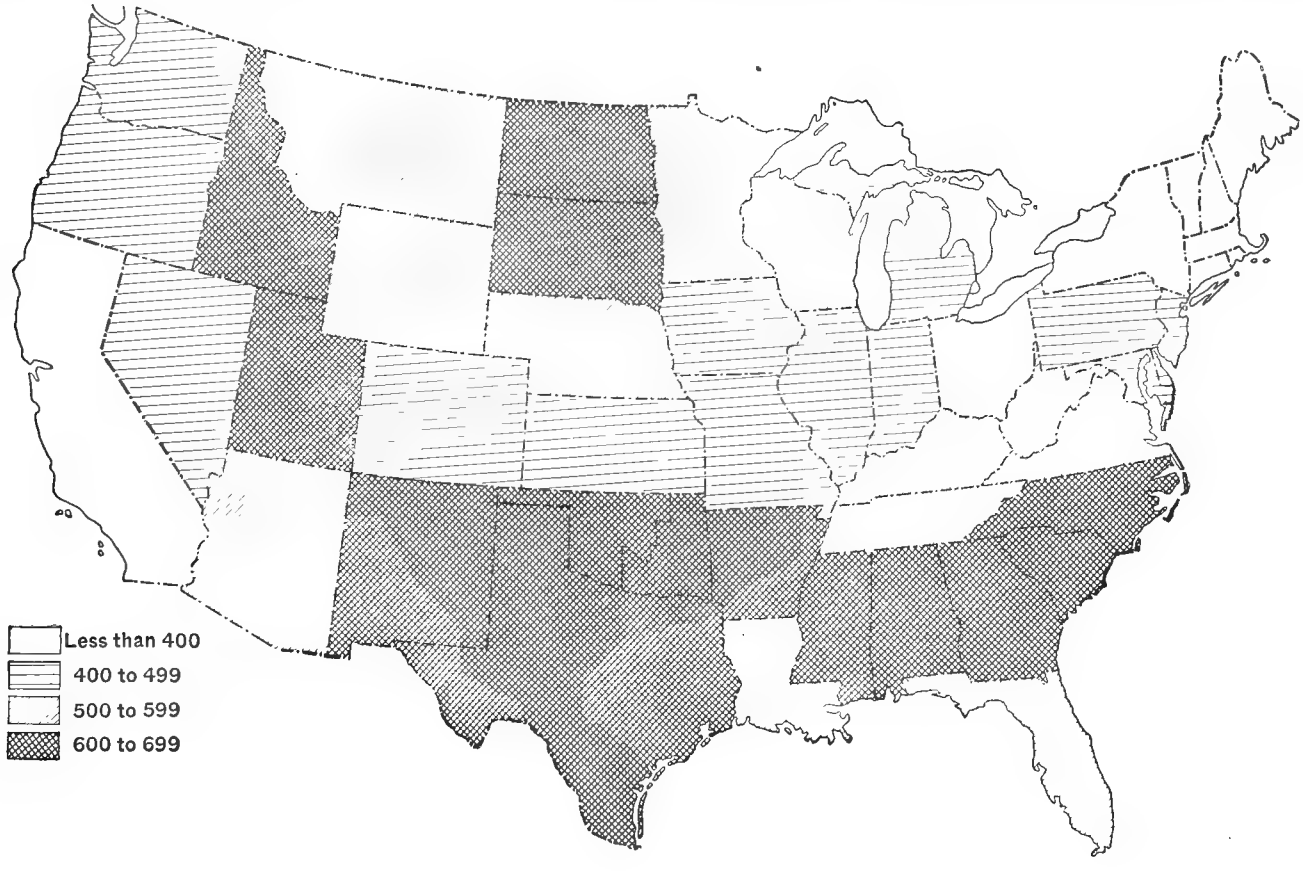
The North and West and the South.—For the purpose of the present analysis the division of the country into Northern and Southern states is most important. That the immigrants have settled mainly in the Northern and Western states is well known. If they were the main cause of the decrease in the birth rate, the decrease would probably be confined mainly to the North and West. The following figures show the proportion of children at each census for these divisions:

TABLE III.—*Number of children under 5 years of age to each 1,000 females 15 to 49 years of age, and decrease in the number during the preceding 10 years, for the North and West and the South: 1850 to 1900.*

CENSUS.	NUMBER OF CHILDREN UNDER 5 YEARS OF AGE TO 1,000 FEMALES 15 TO 49 YEARS OF AGE.			
	In North Atlantic, North Central, and Western divisions.	Decrease in preceding decade.	In South Atlantic and South Central divisions.	Decrease in preceding decade.
1900	427	14	580	7
1890	441	59	587	98
1880	500	48	685	[1]62
1870	548	59	623	62
1860	607	[1]25	685	14
1850	582	.....	699	.....

[1] Increase.

The foregoing figures show that the proportion of children in the North and West increased from 1850 to 1860, decreased with regularity for the next three decades, and at a much slower rate between 1890 and 1900. In the South the changes have been less regular and the decline less marked. In 1850 the proportion of living children to 1,000 women in the North and West was about five-sixths of that in the South; in 1900 it was less than three-fourths.



States and territories.—The following table, showing the number of children under 5 years of age to 1,000 females between 15 and 49, is given for each census from 1850 to 1900 and for each state and territory of the country:

TABLE IV.—*Number of children under 5 years of age to 1,000 females 15 to 49 years of age, by states and territories: 1850 to 1900.*

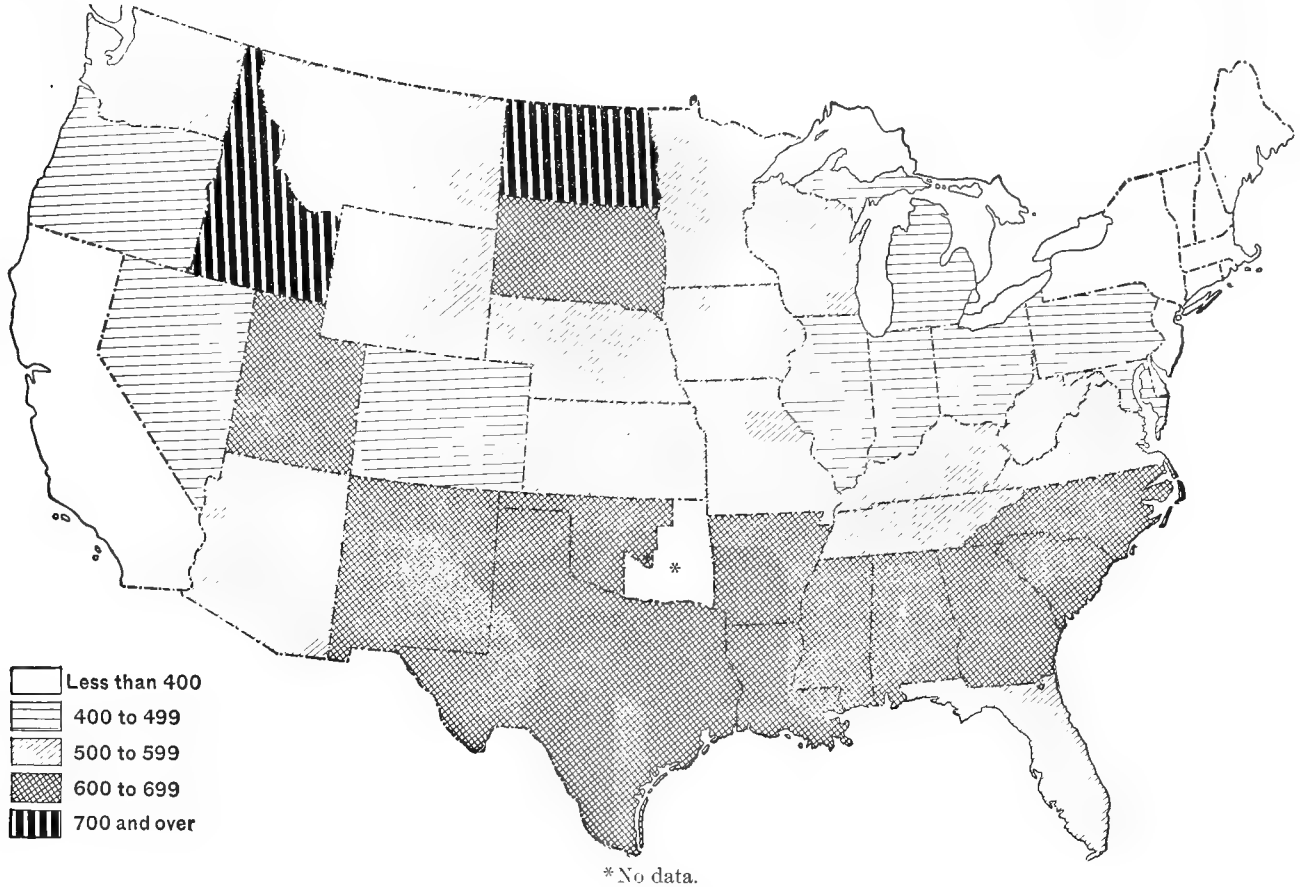
Noticing first the figures for 1900, there is found to be a very wide range in the proportion of children, the minimum being in the District of Columbia, where there is hardly more than one-fourth as many children under 5 years of age as there are women between 15 and 49. This suggests that cities may have a small proportion of children, a conjecture to be tested later in the present analysis. It may be noted here, however, that the conjecture is strengthened by the fact discovered in analyzing the figures for marital condition, that the proportion of adults, and especially of young adults, who are married, is much less in large cities than it is in country districts. The maximum proportion of children is in North Dakota and Indian Territory, in each of which they are more than two-thirds the number of women. The geographical interpretation of this column will be aided by the following map, in which the states and territories are shaded according to the proportion of children to 1,000 women in 1900:

MAP 43.—NUMBER OF CHILDREN UNDER 5 YEARS OF AGE TO 1,000 FEMALES 15 TO 49 YEARS OF AGE: 1900.



A comparison of table and map shows that the smallest proportion of children is in the northeastern states, Massachusetts coming next after the District of Columbia, and the states having less than 400 children to 1,000 women, including along with the District of Columbia all the New England states, New York, and Ohio. One state of the Far West also, California, comes into the same class. The states having between 400 and 500 children per 1,000 women include all the other northeastern states as far south as the Potomac, several states of the upper Mississippi valley, this belt extending as far west as Colorado, and three other states of the Far West, Washington, Oregon, and Nevada. The states having between 500 and 600 children include most of the border states and several in the Northwest. The states with over 600 children include most of the states of the Far South in which the negro population is numerous, certain rapidly growing agricultural states, the Dakotas and Oklahoma, and the two states in which the influence of the Mormon church is most notable, Utah and Idaho.

There is a band of states extending from Maine to California and broken only by Utah in which the proportion of children is below 500 to 1,000 women, and in all these states, except Kansas, the proportion is below the average for continental United States, 474 to 1,000 women. This band is flanked to the south from Virginia to Arizona and to the north from Wisconsin to Idaho by states and territories having more than 500 children to 1,000 women.

Examining the column giving the proportions for 1890, it appears that the minimum was in the District of Columbia and New Hampshire; the maximum in North Dakota and Idaho. A map similar to the one already given for 1900, but representing the proportions for 1890, will throw some light upon the conditions of the earlier year and indirectly upon the changes during the decade.

MAP 44.—NUMBER OF CHILDREN UNDER 5 YEARS OF AGE TO 1,000 FEMALES 15 TO 49 YEARS OF AGE: 1890.

*No data.

In all states of the North Atlantic division, except Pennsylvania, there were less than 400 children to 1,000 women, the only other divisions in the country of which this was true being the District of Columbia and California. The states having between 400 and 500 children to 1,000 women included all the others north of the Potomac and Ohio and east of the Mississippi except Wisconsin. This group included, also, in the Western division, Colorado, Nevada, and Oregon. The contrast between Utah and the states immediately east and west of it is perhaps the sharpest to be found anywhere in the country. In 1900 Utah had, per 1,000 women, 233 more children than Colorado, 225 more than Nevada, and 309 more than California. The only approach to these differences between adjoining states is found in the District of Columbia, which had 165 fewer children to 1,000 women than Maryland, 283 less than Virginia, and 334 less than West Virginia. But in the last case the essential difference is probably that between city and country.

In the four earlier censuses covered by the figures the uniformly low proportion of children in the New England states and the high proportion in certain Western states, especially those dominated by the Mormon church, are perhaps the most striking features. In 1880 the two states with the largest proportion of children were Utah and Idaho; in 1870, Utah and Washington; in 1850 and 1860, Oregon and Utah. At each of these four censuses New Hampshire was one of the two states with the smallest proportion of children, the other being at two censuses Massachusetts, and at two censuses Rhode Island. It was only in 1890 and 1900 that the District of Columbia had a smaller proportion of children than any state or territory.

Comparison between the first two columns of the preceding table shows that the decrease in the proportion of children which occurred between 1890 and 1900 in the country did not extend to a single state of the North Atlantic division. There were also seven

other states or territories, three of them in the Western division, in which the proportions of children in 1900 were somewhat greater than in 1890.

Table IV shows that in six states, namely, Maryland, Ohio, Indiana, Illinois, Michigan, and Kentucky, the proportion of children to women and therefore probably the birth rate decreased in each of the five decades. The total amount of that decrease is shown by the following figures:

STATE.	NUMBER OF CHILDREN UNDER 5 YEARS OF AGE TO 1,000 FEMALES 15 TO 49 YEARS OF AGE.		Decrease in fifty years
	1900	1850	
Maryland	425	591	166
Kentucky	534	740	206
Michigan	425	652	227
Ohio	393	670	277
Illinois	437	746	309
Indiana	423	763	340

The states in which the proportion of children changed in conformity with the changes in the country as a whole, i. e., increased, 1850 to 1860 and then steadily decreased to 1900, were not so important in population as the foregoing. They included Delaware, District of Columbia, Wisconsin, Minnesota, Iowa, Utah, Oregon, and Colorado. The change in the whole country, therefore, was not typical of what was true of most of its parts, but was rather the resultant of opposite changes. The increase in the proportion of children in the whole country, 1850 to 1860, was due mainly to the increase in most of the populous manufacturing states of the Northeast—New Hampshire, Massachusetts, Connecticut, New York, New Jersey, Pennsylvania, Delaware—and partly also to a similar change in certain Western states —Wisconsin, Minnesota, Iowa, Utah, Oregon, and Colorado—the combined influence of which outweighed a decrease in most of the agricultural states east of the Mississippi—Maine, Vermont, North Carolina, South Carolina, Georgia, Florida, Ohio, Indiana, Illinois, Michigan, Kentucky, Tennessee, Alabama, and Mississippi, together with Missouri and Arkansas.

The almost universal decrease in the proportion of children between 1860 and 1870 is shown strikingly by the table. If that decrease had been confined to the Southern states, it might have been explained as due mainly to the omissions in the census of 1870 at the South, but appearing as it does in every state east of the Mississippi, north as well as south, and in every state west of the river, too, for which the information is available, except Dakota territory, Louisiana, and Colorado, it must be attributed mainly to the Civil War and its effects upon the birth rate.

The increase in the proportion of children between 1870 and 1880 was practically confined to the southern coast states from Virginia to Texas and the adjoining inland states, West Virginia, Tennessee, and Arkansas. How far this was merely an apparent increase due to the influence of the omissions of 1870, and how far a real increase due to the return of orderly and stable government after the confusion and turmoil entailed by the Civil War and Reconstruction, it is impossible to say. But so widespread an increase can not be satisfactorily explained by the former cause alone, and therefore it may be supposed that both influences cooperated.

The decrease between 1880 and 1890 was even more widespread than that between 1860 and 1870, the only exceptions to its universality being Arizona and New Mexico. Probably the main factor in this case was an actual decrease in the proportion of children, but this was undoubtedly accentuated by the change in the form of the age question, making the only comparison possible one between the children less than 5 years old in 1880 and the children less than an age which, according to the instructions, should have been 4½ years old in 1890.

The decrease in the proportion of children between 1890 and 1900 in the country as a whole was due mainly to the controlling influence of changes west of the Alleghenies. In all the states of the Atlantic divisions from Maine to North Carolina, inclusive, except Delaware, Maryland, and the District of Columbia, the proportion of children was greater in 1900 than in 1890. But almost everywhere else in the country the reverse was true, the exceptions—Oklahoma, New Mexico, Montana, and Nevada—hardly breaking the uniformity of the rule; for in 1890 Oklahoma had been settled only a few months, not long enough for children to be born, and families with young children were probably not numerous among the pioneer settlers. The counting of Indians on reservations in 1900 but not in 1890 may explain the change in New Mexico. The increase of children in every state of the North Atlantic division 1890 to 1900 was probably a result of the heavy immigration of 1880 to 1890, and of the high birth rate among the immigrants shortly after their arrival.

PROPORTION OF CHILDREN BY RACE.

White children.—The number of white children under 10 years of age and the total white population were reported by every census from 1800 to 1900, inclusive. The number of white children under 5 years of age was reported by every census from 1830 to 1900, inclusive. The figures make it possible to compute for one hundred years the per cent of white children under 10 years of age and for seventy years the per cent of white children under 5 years of age in the white population. The results are given in the following table:

TABLE V.—NUMBER AND PER CENT OF CHILDREN UNDER 10 AND 5 YEARS OF AGE, RESPECTIVELY, IN THE WHITE POPULATION, AND DECREASE IN PER CENT DURING THE PRECEDING 10 YEARS: 1800 TO 1900.

CENSUS.	WHITE POPULATION.			PER CENT OF WHITE POPULATION.		DECREASE IN PER CENT.

[1] General enumeration. [2] Increase. [3] Exclusive of 6,100 persons in the military and naval service. [4] Exclusive of 5,318 persons in the military and naval service.

The figures show that the decrease in the proportion of white children under 10 years of age began as early as 1810 to 1820 and continued without interruption, but with varying rapidity, to the end of the century. The greatest decreases were found in the decades of greatest immigration and may have been partly due to the disproportionate increase of the adult population in that manner. From the earliest census at which the figures were given there has been a decrease in the proportion of children under 5 years of age at each decade except 1850 to 1860, but that decrease between 1890 and 1900 was insignificant.

It will be noticed that the two decades having the smallest decrease in the proportion of children are those immediately following a vast influx of immigrants. It is probable that these immigrants, living in the United States under conditions on the average much superior to those lived under in Europe and belonging, in the main, to the period of early adult life, would have, during the years following their arrival, a very large birth rate. This may account for the very slight decrease in the decades mentioned.

A table in the form of the preceding, comparing the number of children with the total population, is open to the objection already mentioned, that the decrease in the proportion of children might be due simply to the increased vitality and longevity of the population, and would not, therefore, prove that the birth rate had decreased. For this reason a comparison of the white children with the number of white women between 15 and 49 years of age, has been made for the longest period of time possible with the returns. The results are shown in the following table:

TABLE VI.—*Number of white children under 5 years of age to 1,000 white females 15 to 49 years of age, by states and territories: 1830 to 1900.*

Noticing first the proportions for 1900 in the white population as in the total, the two states with the largest proportion of children are North Dakota and Indian Territory and the two with the smallest proportion are the District of Columbia and Massachusetts. There are three separate regions in which the proportion of white children is below the average for the entire country. The first and much the most important includes every state north of the Potomac and Ohio and east of the Mississippi, except Wisconsin; the second includes the three far western states, Oregon, California, and Nevada; the third is Colorado. The uniformly high rate in every Southern state is evidence that the high proportion among the total population in that region is not due to the influence of the negroes upon the total figures.

The table shows that in continental United States the proportion of white children to white women 15 to 49 decreased in six of the seven decades between 1830 and 1900 and to a total amount of 316 children in seventy years. That is, the number of living children to 1,000 white women in 1900 was less than three-fifths of what it was in 1830. The one decade in which the proportion increased (1850 to 1860) and the one in which its decrease was far smaller than in any other (1890 to 1900) were the two immediately following the great waves of immigration in 1840 to 1850 and 1880 to 1890.

The states in which the proportion of children increased among the white population, 1890 to 1900, included every one in the two Atlantic divisions, except Maryland, District of Columbia, and Georgia, in which there was no change. They included also Alabama, Louisiana, Oklahoma, and Nevada. The states with the largest and smallest proportion of children among the white population at successive censuses were as follows:

CENSUS.	NUMBER OF CHILDREN UNDER 5 YEARS OF AGE TO 1,000 FEMALES 15 TO 49 YEARS OF AGE IN THE WHITE POPULATION.			
	Maximum.		Minimum.	
1830	Arkansas	1,196	Massachusetts	502
1840	Arkansas	1,128	Massachusetts	470
1850	Oregon	953	New Hampshire	391
1860	Oregon	1,100	New Hampshire	406
1870	Washington	986	New Hampshire	350
1880	Utah	848	New Hampshire	330
1890	North Dakota	735	District of Columbia	289
1900	North Dakota	700	District of Columbia	275

The proportion of white children in the District of Columbia is less than two-fifths of what it is in North Dakota.

Negro, Indian, and Mongolian children.—The total number of negroes, Indians, and Mongolians in the United States and the number under 10 years of age have been reported at each census since 1830, inclusive. A great majority of these, especially at earlier censuses, when there were no Mongolians in the country and when few Indians were reached by the census, were negroes. Even in 1900 nineteen-twentieths were of that race; consequently the figures are substantially the same as they would be if only negroes were concerned. The number and per cent of children in the total non-Caucasian population is shown in the following table:

TABLE VII.—NUMBER AND PER CENT OF CHILDREN UNDER 10 AND 5 YEARS OF AGE, RESPECTIVELY, IN THE NEGRO, INDIAN, AND MONGOLIAN POPULATION, AND DECREASE IN PER CENT DURING THE PRECEDING 10 YEARS: 1830 TO 1900.

CENSUS.	NEGRO, INDIAN, AND MONGOLIAN POPULATION.			PER CENT OF NEGRO, INDIAN, AND MONGOLIAN POPULATION.		DECREASE IN PER CENT.

[1] General enumeration. [2] Increase.

The proportion of negroes under 10 years of age, unlike that for whites, has not steadily decreased. On the contrary, the proportion in 1880 was greater not merely than that in 1870, but also greater than that in 1860 or 1850. The very low proportion for 1870 may be and possibly is due, in large measure, to omissions, especially for children. But the very high proportion in 1880 suggests that a greatly increased birth rate, and consequently a rapid increase in the proportion of young children, was one of the first results of emancipation. If that be admitted, the parallel between the emancipated negroes in the South and the emancipated serfs in Russia, the rate of increase among whom since emancipation has been extraordinary, is a striking one. It is noteworthy also that the decrease in the proportion of children among the colored in twenty years, from 1880 to 1900, was much greater than the decrease from 1830 to 1850 or from 1840 to 1860, suggesting that the decline in the birth rate among the negroes during the last score of years has been unusually rapid. The proportion of children under 5 years of age was at its height in 1850 and 1880 and, neglecting the figures for 1870 as untrustworthy, it was least in 1900. Comparing this table with that for the whites, it appears that at every census, except that of 1870, the proportion of children among the colored population was greater than among the whites. But a comparison of the number of children with the total population is less significant than a comparison with the number of women of child-bearing age. The comparison in the latter form will be found in the table which follows. For the purposes of comparison the proportions in the total population and among the whites have been introduced:

TABLE VIII.—*Number of children under 5 years of age to 1,000 females 15 to 49 years of age in the total, the white, and the negro, Indian, and Mongolian populations and the excess among the negroes, Indians, and Mongolians: 1850 to 1900.*

CENSUS.	NUMBER OF CHILDREN UNDER 5 YEARS OF AGE TO 1,000 FEMALES 15 TO 49 YEARS OF AGE.			
	Total population.	White population.	Negro, Indian, and Mongolian population.	Excess among the negroes, Indians, and Mongolians.
Continental United States:				
1900	474	465	543	78
1890	485	473	574	101
1880	559	537	706	169
1870	572	562	641	79
1860	634	627	675	48
1850	626	613	694	81

The largest proportion of children among the negroes was found in 1880 and the smallest in 1900, when there were hardly more than three-fourths as many children to 1,000 women as twenty years earlier. There has been uniformly a larger proportion of negro children than of whites. That difference more than trebled between 1860 and 1880, but in 1900 it was less than half what it was in 1880 and less than at any other census except 1860.

The high proportion of children in the Southern states has already been noticed. As nearly nine-tenths of the negroes and only one-fourth of the whites live in the South, it may be found more significant to limit the

comparison between the two races to the Southern states. This is done in the following table:

TABLE IX.—*Number of children under 5 years of age to 1,000 females 15 to 49 years of age in the total, the white, and the negro, Indian, and Mongolian populations and the excess among the negroes, Indians, and Mongolians, for the South: 1850 to 1900.*

CENSUS.	NUMBER OF CHILDREN UNDER 5 YEARS OF AGE TO 1,000 FEMALES 15 TO 49 YEARS OF AGE.			
	Total population.	White population.	Negro, Indian, and Mongolian population.	Excess among the negroes, Indians, and Mongolians.
South Atlantic and South Central divisions:				
1900	580	581	577	[1] 4
1890	587	580	601	21
1880	685	656	737	81
1870	623	601	661	60
1860	685	682	688	6
1850	699	695	705	10

[1] Excess among the whites.

The figures show that the largest proportion of negro children was found in 1880, when there were 32 more to 1,000 women than in the next highest proportion, that of 1850. Among whites, on the contrary, the proportion of children in 1880 was less than in 1850 or 1860. At the two censuses preceding the Civil War the proportion of children for the two races at the South was substantially the same. The immediate effect of the Civil War and Reconstruction, if the figures of 1870 may be trusted to that extent, was to reduce the proportion of children among southern whites by about one-eighth and among the negroes by about one twenty-fifth. The following decade saw an increase in the proportion for each race, but as the decrease among the negroes, 1860 to 1870, had been less, so was the increase, 1870 to 1880, greater. But between 1880 and 1900 there was a decrease of 160 in the number of negro children at the South to 1,000 negro women and a decrease of only 75 white children to 1,000 white women. As a result, in 1900 there were for the first time more white children than negro children at the South to 1,000 women.

PROPORTION OF CHILDREN IN CITY AND COUNTRY.

Main geographic divisions.—At the censuses of 1890 and 1900 the number of children under 5 years of age and the number of women between 15 and 44 years of age were given for every city in the United States having at least 25,000 inhabitants. By grouping these cities under the states in which they lie and subtracting the total urban population of a state as thus defined, it is possible to get the number and proportion of children living in the smaller cities and country districts. It is unfortunate that the age question was asked in a different way at these two censuses, this change probably affecting the figures to an indeterminate degree. Notwithstanding that fact, the figures are significant and are therefore presented in detail. In 1900 the 160 cities of at least 25,000 inhabitants in the United States had 390 children to 1,000 women of child-bearing age, and the country outside these 160 cities had 572 children to 1,000 women; that is, the proportion of children in cities was little more than two-thirds as great as in the rest of the country. But the difference between the different divisions of the country has already been noticed and it is possible that this difference affects the foregoing figures.

Accordingly the proportion for each of the five great divisions has been computed. Assuming the proportion of children in each division as 100, the ratio of the proportion in cities and in country districts, respectively, and the difference between city and country, are stated in the following table:

TABLE X.—*Number of children under 5 years of age to 1,000 females 15 to 44 years of age in cities having at least 25,000 inhabitants and in smaller cities or country districts by main geographic divisions, and the ratio of those numbers to the number for the whole division taken as 100: 1900.*

DIVISION OR RACE.	NUMBER OF CHILDREN UNDER 5 YEARS OF AGE TO 1,000 FEMALES 15 TO 44 YEARS OF AGE: 1900.			RATIO TO NUMBER IN WHOLE DIVISION, TAKEN AS 100, OF NUMBER—		Difference in ratio.
	Total.	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.	In cities having at least 25,000 inhabitants	In smaller cities or country districts.	
Total population:						
Continental United States	518	390	572	75.3	110.4	35.1
North Atlantic division	429	407	452	94.9	105.4	10.5
South Atlantic division	608	334	658	54.9	108.2	53.3

Western division	477	318	545	66.7	114.3	47.6
Negro, Indian, and Mongolian population:						
Continental United States	585	260	651	44.4	111.3	66.9
North Atlantic division	297	252	376	84.8	126.6	41.8
South Atlantic division	630	269	687	42.7	109.0	66.3
North Central division	370	227	476	61.4	128.6	67.2
South Central division	612	274	653	44.8	106.7	61.9
Western division	516	267	576	51.7	111.6	59.9

The table shows that the main divisions of the United States differ widely in the effect produced

upon the figures by drawing the distinction between city and country. In the North Atlantic division the large cities have almost as great a proportion of children as the smaller cities and country districts. In southern cities, on the contrary, the proportion of children is hardly more than half as great as it is in the same division outside of these cities. In the Far West the difference between city and country is intermediate in amount. Thus in passing from the North Atlantic states across the country through the North Central to the Western and back through the South Central to the South Atlantic, the difference between city and country constantly augments. This is probably due, in large measure, to the fact that the immigrant population who have been swarming into northern cities of recent years, especially into the cities of the North Atlantic states, have been multiplying by numerous births with much rapidity, while the corresponding laboring class which has immigrated into southern cities from the surrounding country districts has not been thus increasing. To ascertain whether this conjecture is correct, figures have been computed for each of the two main races. The figures for the non-Caucasians, except in the Western division, may be taken as substantially the same as those for the negroes, were the latter obtainable.

These figures for races show that in continental United States the proportion of children outside the large cities among the negroes, Indians, and Mongolians is about one-sixth larger than among the whites. But in the large cities the proportion of children among whites is more than one-half larger than among the negroes, Indians, and Mongolians. This difference between the races is practically universal. There were 125 cities in the United States in 1900 having at least 25,000 inhabitants and at least 100 women of each race between 15 and 44 years of age. Among these there were only eight, namely, Cambridge, Lynn, and Malden, Mass.; Akron, Ohio; Springfield, Ill.; and San Francisco, Los Angeles, and Sacramento, Cal., in which the proportion of non-Caucasian children to 1,000 women equaled that of the whites. No one of these eight cities contained as many as 4,000 negroes. The last three may be disregarded on the ground that probably the figures for non-Caucasians refer quite as largely to Mongolians as to negroes. The other five hardly do more than emphasize the rule that in nearly all cities, and in absolutely all with a large negro population, the proportion of negro children to negro women is less than the proportion of white children to white women. This is the more surprising because in the industrial classes of the population, to which the negroes mainly belong, the birth rate is usually high. It is beyond the scope of this analysis to attempt to suggest the causes for the difference. But one may suggest that the phrase of Süssmilch, writing in the eighteenth century, that cities are the graves of mankind, which was probably true of white residents of cities, even the best governed and the healthiest until about the beginning of the nineteenth century, and which is doubtless still true of certain Russian and oriental cities, is true so far as the negro race is concerned of our American cities. This low proportion of children of both races in southern cities is also probably an important factor in their lower rate of growth in population, already mentioned in the section on Increase of Population.

The following table gives the same information for 1890 as that contained in the preceding for 1900. A comparison of the two throws some light upon the changes for the decade 1890 to 1900.

TABLE XI.—*Number of children under 5 years of age to 1,000 females 15 to 44 years of age in cities having at least 25,000 inhabitants and in smaller cities or country districts by main geographic divisions, and the ratio of those numbers to the number for the whole division taken as 100: 1890.*

DIVISION OR RACE.	NUMBER OF CHILDREN UNDER 5 YEARS OF AGE TO 1,000 FEMALES 15 TO 44 YEARS OF AGE: 1890.			RATIO TO NUMBER IN WHOLE DIVISION, TAKEN AS 100, OF NUMBER—		Difference in ratio.
	Total.	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.	In cities having at least 25,000 inhabitants.	In smaller cities or country districts.	
Total population: Continental United States	529	401	574	75.8	108.5	32.7
North Atlantic division	411	385	431	93.7	104.9	11.2
South Atlantic division	606	362	649	59.7	107.1	47.4
North Central division	539	450	564	83.5	104.6	21.1
South Central division	663	380	692	57.3	104.4	47.1
Western division	512	348	574	68.0	112.1	44.1
White population: Continental United States	517	407	559	78.7	108.1	29.4
North Atlantic division	412	388	431	94.2	104.6	10.4
South Atlantic division	587	385	627	65.6	106.8	41.2
North Central division	541	456	564	84.3	104.3	20.0
South Central division	665	402	693	60.5	104.2	43.7
Western division	516	351	578	68.0	112.0	44.0
Negro, Indian, and Mongolian population: Continental United States	619	305	672	49.3	108.6	59.3
North Atlantic division	328	268	407	81.7	124.1	42.4
South Atlantic division	638	311	685	48.7	107.4	58.7
North Central division	455	294	542	64.6	119.1	54.5
South Central division	659	331	690	50.2	104.7	54.5
Western division	379	250	424	66.0	110.9	44.9

The proportion of children in the United States decreased in the decade by 11, a decrease just equal to that in cities. In country districts, on the contrary, the decrease was only 2. The paradox, that the decrease in the whole country was only just equal to that in cities and was much more than that in country districts, is probably explained by noticing the large number of places which entered this class between

1890 and 1900. In 1890 there were 124 cities, but in 1900, 160, having at least 25,000 inhabitants. The decrease in the proportion of children among non-Caucasians in cities was much greater than the decrease among the whites.

RELATIVE FECUNDITY OF NATIVE AND FOREIGN BORN WOMEN.

The tables which have already been given showing the proportion of children to 1,000 women of child-bearing age, for the whole population and with distinction of race, have been supplemented by other tables in which an effort has been made to distinguish between the proportion of children, and thus indirectly between the fecundity of the native and foreign born women. In the preparation of these tables it has been necessary to use estimates. The method of estimating employed can best be understood by an example. The number of native white persons of foreign parentage in the United States in 1900 was 15,687,322. This included all native white persons either or both of whose parents were born abroad. Of this number 12,330,692 had foreign born mothers; the remainder had native mothers and foreign born fathers.[1] This shows that 78.6 per cent of the native white persons of all ages one or both of whose parents were born abroad had foreign born mothers. The number of native white children under five years of age in the United States, one or both of whose parents were foreign born was 2,407,429. It has been assumed that of this number 78.6 per cent had foreign born mothers and the remainder had native mothers and foreign born fathers. On that assumption the number of native white children of foreign born mothers was 1,912,399. The total number of native white children under 5 years of age was 7,877,152. Subtracting the estimated number having foreign born mothers, we have the estimated number having native mothers, 5,964,753. With these two numbers, the number of native white women from 15 to 44 years of age, and of foreign born white women of the same age, may properly be compared.

In obtaining the figures given in the extended tables at the end of this section the number of native white children having foreign born mothers and native mothers, respectively, has been computed for each city having at least 25,000 inhabitants, and for the rest of each state by the method just described, and the totals for each state and for the United States have been obtained by adding the separate items as thus estimated. The result reached for the whole United States by this method of addition differs from the result reached by the more direct method by about 20,000, or a little more than 1 per cent. It is obvious that the method is one of approximation. The results reached by it, however, are believed to be substantially accurate. Probably the error in the proportion of children as thus estimated would not be greater than 1 per cent.

Before accepting these figures as an indication of the relative fecundity of the native and the foreign born white women, some allowance should be made for the difference between the two classes as regards age distribution. This difference is shown in the following table:

TABLE XII.—*Distribution, by age periods, of the white female population 15 to 44 years of age, classified by nativity, for continental United States: 1900.*

AGE PERIOD.	FEMALES 15 TO 44 YEARS OF AGE: 1900			
	Native white.		Foreign born white	
	Number.	Per cent distribution.	Number.	Per cent distribution.
Total	12,889,028	100.0	2,687,924	100.0
15 to 19 years	2,994,734	23.2	290,365	10.8
15 years	618,590	4.8	41,838	1.5
16 years	626,081	4.9	48,761	1.8
17 years	592,823	4.6	55,350	2.1
18 years	597,448	4.6	69,675	2.6
19 years	559,792	4.3	74,741	2.8
20 to 24 years	2,726,267	21.2	463,296	17.2
25 to 29 years	2,312,390	17.9	507,708	18.9
30 to 34 years	1,872,017	14.5	512,981	19.1
35 to 39 years	1,595,465	12.4	504,762	18.8
40 to 44 years	1,388,155	10.8	408,812	15.2

It appears from the above table that 23.2 per cent of the total number of native white women 15 to 44 years of age were under 20 years of age, or in the age group 15 to 19, while of the corresponding class of foreign born white women only 10.8 per cent were in this younger group. When it is remembered that women in the age group 15 to 19 years were by no means possible mothers for the older children in the age group under 5, it becomes evident that on account of this difference in age distribution a comparison based on the proportion of children under 5 to women 15 to 44 will exaggerate somewhat the relative fecundity of the foreign born white women. Referring again to the table it will be found that 14.3 per cent of the native and only 5.4 per cent of the foreign born women were under 18 years, and therefore not possible mothers of children above 3 years of age.

In other words, the assumption that all women between 15 and 44 are of child-bearing age is not quite accurate when we are considering the possible mothers for children of all ages under 5.

This defect in the assumption could be ignored in a comparison between two classes having practically the same age distribution, but when the proportion of women in the younger age group is much larger for one class than for the other, the difference must not be overlooked, in considering the significance as regards the question of fecundity, of figures showing proportion of children under 5 to women 15 to 44. Yet the effect of this difference is probably not serious

[1] Twelfth Census, Vol. I, page 809.

enough to invalidate the general conclusion which may be drawn from an inspection of such figures.

The figures for the proportion of children in 1900 to 1,000 native and foreign born white women are as follows:

CENSUS.	NUMBER OF CHILDREN UNDER 5 TO 1,000 WHITE WOMEN 15 TO 44 YEARS OF AGE.			
	Total.	Native women.	Foreign born women	Difference.
1900	508	462	710	248
1890	517	475	666	191

The preceding figures show that there was a decrease of 9 between 1890 and 1900 in the proportion of all white children to all white women; that in the case of the native whites the decrease was 13, and in the case of the foreign born whites the increase was 44. The total decrease in fecundity was due apparently to a decrease among native white women, partly offset by an increase among foreign born white women. The increase among the foreign born is probably connected with the enormous immigration between 1880 and 1890, and the great number of foreign born women who bore children in this country during the years immediately following that wave of immigration. With reference to the native white women no such powerful influence was at work. Whether the decrease in this class was general over the country is indicated by the following figures:

DIVISION.	NUMBER OF CHILDREN TO 1,000 NATIVE WHITE WOMEN 15 TO 44 YEARS OF AGE.			
	1900	1890	Increase.	Decrease.
Continental United States	462	475	.....	13
North Atlantic	355	354	1	.....
South Atlantic	592	585	7	.....
North Central	431	468	.....	37
South Central	651	659	.....	8
Western	417	465	.....	48

These figures show that in the Atlantic divisions there was a slight increase in the proportion of children living who were born to native white mothers; that in the South Central division the decrease was slight, and that decrease for the whole country was the result very largely of the great decrease in the North Central and Western divisions. So, too, the decrease in the proportion of children was confined chiefly to the cities, as the following figures indicate:

CITY OR COUNTRY.	NUMBER OF CHILDREN TO 1,000 NATIVE WHITE WOMEN 15 TO 44 YEARS OF AGE.		
	1900	1890	Decrease.
City	296	309	13
Country	522	523	1

In consequence of this change the difference between city and country increased from 214 in 1890 to 226 in 1900. Various other inferences will be suggested by a careful inspection and comparison of the figures in Tables XXII and XXIII.

TABLE XIII.—NUMBER OF CHILDREN UNDER 5 YEARS OF AGE AND NUMBER OF FEMALES 15 TO 44 YEARS OF AGE, FOR THE TOTAL POPULATION: 1900, 1890, AND 1880.

OCCUPATIONS.[1]

SUMMARY OF RESULTS.

The occupation tables include only persons 10 years of age and over engaged in gainful occupations of a reputable character. The excluded population includes all persons under 10 years of age and, among those over 10 years old, school children and others attending educational institutions as their main employment; young persons, mainly women, living at home and without gainful occupation; persons living upon their incomes; inmates of prisons, almshouses, and benevolent institutions; and persons reported on the population schedules as engaged in disreputable callings.

In 1900 the persons in Continental United States engaged in gainful occupations as thus defined, or as they may be called, breadwinners, numbered 29,073,233, or 38.3 per cent of the total population.

Only one-seventh of the females, but over three-fifths of the males, are engaged in gainful occupations.

The excess in the proportion of males at work over that of females holds for every period of life. The nearest approach to equality is in youth.

The per cent of breadwinners for males is lowest in youth, rises rapidly up to about the age of 25, remains nearly stationary until about the age of 55, and declines in old age. For women, on the other hand, the decline in the per cent begins at about the age of 20, continues rapidly until about the age of 45, and from that age more slowly.

Among men, much the highest proportion of breadwinners is found among the married and the lowest among the single, while widowers and divorced men have an intermediate proportion of breadwinners. With women, on the contrary, the highest proportion of breadwinners is among the divorced and much the lowest among the married; while the proportion among single women and widows is intermediate.

The foregoing differences among men are due mainly to the difference in the average age of the four groups and among women mainly to the influence of marriage in withdrawing women from gainful occupations.

In cities having at least 50,000 inhabitants there are 58 more breadwinners to each 1,000 persons 10 years of age or more than there are in the rest of the country. Much of this difference is due to the smaller proportion of youth and aged persons in the cities. When correction is made for this dissimilarity in age constitution the difference between city and country sinks to 35 breadwinners per 1,000.

Among males, after correcting for differences of age distribution, the proportions of breadwinners in city and country are the same, a slightly larger proportion in cities between 10 and 65 years of age being just counterbalanced by the much larger proportion of men in the country who continue at work after reaching 65 years of age.

Among females on the contrary there are 73 more breadwinners per 1,000 in cities than in the country, the difference being most marked in the earlier age periods.

A classification of the population by race and nativity shows that the foreign born whites have the largest per cent (56.2) of breadwinners and that the native whites of native or foreign parentage have the smallest (33.9). This wide difference is due in a large measure to differences in age composition and perhaps in the proportion of sexes in the classes.

When the figures are adjusted so as to eliminate the effect of differences in age composition it will be found that for men and women alike the per cent of persons who engage in some remunerative occupation is highest among the non-Caucasian population and next highest among the white immigrants. It is lowest among the native white males of foreign parentage and among the native white females of native parentage.

For all race and nativity classes the proportion of middle-aged males at work is remarkably uniform. The largest proportion of men continuing at work after the age of 55 is reached is found among the non-Caucasian population; the next largest among the native whites of native parentage; the smallest among the foreign born whites. The explanation of these differences lies in the character of the predominant occupations rather than in racial differences.

In general the per cent of breadwinners among youth varies inversely as the per cent attending school.

[1] This section is based upon a report prepared by Prof. Wesley C. Mitchell, of the University of California, who was formerly employed by the Census Office and devoted himself to a special study of occupation statistics.

Among women after the age of 24 is passed the non-Caucasians have a decline in the per cent of breadwinners much less decided than that of any of the other classes. This is due to the fact that the number of negro women who continue to follow gainful occupations after marriage is very large.

In general, the per cent of breadwinners is high in the Northeastern and Western states and low in the Central and Southern states. The maximum per cent, 47.8, is in Wyoming and the minimum, 30.6, in Utah. The explanation of this difference is largely to be found in the varying proportions of the population in these divisions according to race, nativity, sex, and age.

Almost six persons more in every hundred were earning money for themselves in 1900 than in 1870. The apparent increase from 1870 to 1880 was slight, and undoubtedly resulted from a better enumeration. That from 1880 to 1900, on the other hand, was more marked and almost wholly due to a change in the character of the population—particularly a diminution in the proportion of children.

SOURCE OF DATA.

The information upon which the occupation tables are based consists of the answers made to two questions upon the population schedule. These questions are stated as follows:

Occupation, trade, or profession of each person 10 years of age and over.

19. Occupation.

20. Months not employed.

The book of instructions issued to enumerators contains elaborate and explicit directions regarding the kind of replies desired. A person's occupation is defined as "the profession, trade, or branch of work on which each person depends chiefly for support, or in which he is engaged ordinarily during the larger part of the time." This is made more definite by adding the following caution: "Indicate in every case the kind of work done or character of service rendered. Do not state merely the article made or worked upon, or the place where the work is done."

Occasion will arise in the course of the following discussion for comment upon the accuracy with which the directions were followed by the enumerators, upon the consequent reliability of the data, and upon the methods of compilation followed in the Census Bureau. For this reason nothing need be said here upon these subjects.

SCOPE OF TABLES.

The occupation tables include only persons at least 10 years of age engaged in "gainful" occupations of a reputable character. These persons form but little more than one-third of the total population. Of the remaining two-thirds no notice is taken. To understand the precise scope and meaning of the tables, therefore, it is necessary to define with some care the classes of persons omitted from the tables and the distinction made between gainful and nongainful occupations.

From the economic point of view the excluded population of 46,921,342 persons is made up of heterogeneous elements. First, there are the children under 10 years of age, all of whom, even those who were reported on the schedules as at work, were assigned to the "nongainful" class. They make 18,044,751, or 38.5 per cent of the whole number. Second, school children at least 10 years of age and young men and women attending colleges and professional schools are seldom regularly engaged in any trade, business, or profession. Their number is reported as 9,056,820. Third, there is a large but ill-defined body of persons, particularly young women, who live at home and do nothing that can be regarded as work. These three classes, together with persons incapacitated for work by illness, injury, or age, may fairly be considered the element of the population that is nonproductive and is supported by the efforts of the active workers.

With the next element of the excluded population—women managing the affairs of their households—the case is very different. The wife, sister, or adult daughter who "keeps house" for her family, though she receives nominally no pecuniary return for her services and does not regard herself as having a gainful occupation, is helping to sustain the productive capacity of the community quite as truly as her male relatives who are earning money wages. The number of housewives was not tabulated separately, and therefore can not be stated with accuracy; but the tables show that in 1900 there were 13,044,310 wives and 1,860,834 widows not reported as engaged in gainful occupations. Doubtless many of these women, because of physical incapacity or for other reasons, were not superintending their domestic affairs; but, on the other hand, there were many unmarried women keeping house for their fathers or brothers. Without venturing a definite estimate of the number, we may be certain that among the persons of whom no account is taken in the occupation tables there are several million housewives who must be regarded as productive laborers.

Unlike either of the preceding cases is that of persons of means who are content to live upon the income from their property without trying to increase it by engaging in any trade or profession. They are not dependent upon any individual for support, but they contribute nothing to the productive power of the community beyond permitting others to utilize their capital.

Inmates of prisons, almshouses, and benevolent institutions are also placed in the nongainful class, despite the fact that in many such institutions the inmates are productively employed. In so far as this is the case, these inmates are in much the same position as housewives, not carrying their wares to market, but still

producing economic utilities of recognized value, and therefore not to be regarded as a burden borne by the community.

Finally, persons reported on the population schedules as engaged in disreputable callings are not credited with having gainful occupations. Ordinarily a professional thief, gambler, or keeper of a house of ill fame makes a false return, telling the enumerator, for example, that he is a night watchman, a speculator, or a boarding-house keeper. Such persons, of course, are classified by the Census Bureau according to the occupation which they claim. But in the comparatively few cases where the truth is told the return is entirely disregarded and the person treated as having no occupation.

From this necessarily imperfect analysis of the population omitted from the occupation tables, it is clear that the Census distinction between gainful and nongainful occupations is by no means identical with the economic distinction between productive and unproductive laborers. On the one hand, the nongainful class includes, as has just been shown, several million productive laborers, and on the other hand, some of the persons credited with gainful occupations would not be recognized by all economists as productive laborers—e. g., professional athletes and clairvoyants.

But, though the division of the population made by the Census does not coincide with the economic distinction which it seems at first sight to suggest, it has a valid justification. A negative reason for it might be found in the insuperable difficulties that would beset an attempt to divide the whole population into productive and unproductive laborers by means of information collected through agents having as little economic training as have census enumerators. But, beyond this, the distinction which the Census Bureau found it practicable to make, is based upon a real difference in the economic life of the gainful and nongainful classes. A man and his wife may both be productive laborers, but their positions are nevertheless very unlike. The quality of a man's living depends in general upon his economic efficiency. But in the case of a housewife such a direct relation can hardly be said to exist. On the contrary, the manner in which a wife lives generally varies inversely as the amount of work she does. If her husband is successful in his business, she enjoys a comfortable or luxurious style of living and, at the same time, is relieved in large measure of the burden of domestic labor. But if her husband does not prosper, the wife is likely to work hard and fare ill. In short, the wife, though a productive laborer, is a dependent, in the sense that her position in society is determined by her husband's and not by her own economic efficiency.

Connected with this is another difference. The husband who has a gainful occupation enters some part of the wide field of economic competition, and both affects and is affected by the conditions of demand and supply obtaining in his particular market. But his wife, who does not take the economic satisfaction which she produces to market, does not in the same manner influence market conditions, nor on the other hand is she influenced by them. She does not experience the cultural discipline of direct economic competition, and her work does not form a part of the market supply of labor which directly affects the rate of wages.

There are, then, real differences between the position of those productive laborers who have and those who have not gainful occupations. The fact that the Census undertakes to present data regarding the former only is admitted to be a serious limitation of its scope. But this limitation does not involve any inconsistency of purpose and need not betray the reader into mistaken inferences, provided the nature of the material furnished is clearly recognized. What the occupation tables taken as a whole show, is the number of persons at least 10 years of age who were reported by the enumerators as earning money regularly by the exercise of some reputable calling.

For the sake of brevity the term "breadwinners" will be used throughout the following discussion to designate these persons. Perhaps it might be said that the breadwinners are the "self-supporting" part of the population, or that they are persons who "earn their own living." But such an interpretation is, strictly speaking, inexact, because some of the women and children who were returned as gainfully occupied probably did not earn sufficient to defray the entire expense of their living.

To find an appropriate term for the heterogeneous class of persons not included in the tables is more difficult. It is natural to think of them in contrast with the breadwinners as "dependents," but this term conveys a wrong impression, because persons of sufficient means to live without work are included with the children and others. Indeed, any term of positive significance, chosen because it fitted some element of the class, would almost certainly be inappropriate as regards other elements. Under the circumstances the safest course is to select some colorless term which, though it means little considered by itself, at least implies nothing amiss. For this reason, when it is inconvenient to use the whole phrase, "persons not having gainful occupations," the title "residual class" will be employed.

CONTINENTAL UNITED STATES.

Total population.—Study of the occupation tables begins appropriately with the most general question which they may be made to answer, namely, What proportion of the people of continental United States in 1900 were engaged in gainful occupations? or, in less technical language, What proportion were earning money for themselves?

In the simplest form the reply is that the breadwinners numbered 29,073,233, or 38.3 per cent of the

total population of 75,994,575. The residual class of persons without gainful occupations, accordingly, made 61.7 per cent of the population. In actual numbers they exceeded the breadwinners by 17,848,109. Another way of expressing the relation is to say that for every 3 persons who were earning money for themselves there were 5 others who were not.

Sex.—By a slight further analysis statistical confirmation may be obtained of the common observation that a much larger proportion of males than of females are gainfully employed. The data showing the extent of this difference are given in Table I.

TABLE I.—*Number and per cent of breadwinners in population, classified by sex: 1900.*

SEX.	Population: 1900.	BREADWINNERS: 1900.	
		Number.	Per cent.
Continental United States	75,994,575	29,073,233	38.3
Male	38,816,448	23,753,836	61.2
Female	37,178,127	5,319,397	14.3

According to these figures only one-seventh of the females, as against over three-fifths of the males, are engaged in gainful occupations. Differently put, while males constitute 51.1 per cent of the population they make 81.7 per cent of the breadwinners.

Sex and age periods.—More specific results are obtained by combining a classification according to age with the sex distinction. This combination is made in Table II.

TABLE II.—*Per cent of breadwinners in male and in female population, classified by age periods: 1900.*

AGE PERIOD.	PER CENT OF BREADWINNERS IN POPULATION: 1900.	
	Male.	Female.
Continental United States: All ages	61.2	14.3
10 to 15 years	26.1	10.2
16 to 20 years	76.8	32.3
21 to 24 years	93.1	30.8
25 to 34 years	96.3	19.9
35 to 44 years	96.6	15.6
45 to 54 years	95.5	14.7
55 to 64 years	90.0	13.2
65 years and over	68.4	9.1
Age unknown	59.6	24.2

The excess in the proportion of males at work over that of females is seen to hold for every period of life. In childhood the sexes are most nearly on even terms, the per cent of girls between the ages of 10 and 15 years earning money being to that of boys as 2 to 5. At later ages the difference in the relative number of the sexes who engage in gainful occupations becomes very much greater. While but 1 boy in 4 for the first age group and 3 in 4 for the second are money earners, the proportion rises to over 9 in 10 among the young men of 21 to 24 years. In the thirty succeeding years, from 25 to 54, there is little variation. At this period, which includes the prime of life, only 3 or 4 men in 100 are not gainfully occupied. But after the age of 54 or thereabouts men commence to give up active business in sufficient numbers to reduce materially the per cent of breadwinners. The relative number of such retirements increases as age advances, so that in the last period of life recognized by the classification less than 7 men in 10 continue at active work.

With women the per cent of breadwinners fluctuates in a very different fashion. Instead of a rise in the per cent up to the middle twenties, followed by thirty years when the per cents are nearly constant and almost everyone engages in some gainful occupation, there is a sharp falling off in the per cent after the early rise. The maximum proportion of women engaged in gainful occupations is about 1 in 3 for the age period 16 to 20 years. In the next period this drops to 3 in 10, and in the next to 1 in 5. In place of a practically unchanging per cent between 25 and 54 there is after 24 years of age a gradual decline.

In seeking an explanation for the striking decline in the proportion of women who serve as breadwinners between the ages 21 to 24 and 25 to 34, the thought at once suggests itself that marriage may have much to do with it. This hypothesis is confirmed by the results of the discussion presented in the paragraphs which follow.

Marital condition.—Table III supplies the data for a comparison of the effect of marriage upon the per cent of breadwinners among males and females.

TABLE III.—*Per cent of breadwinners in male and in female population at least 10 years of age, classified by marital condition: 1900.*

SEX.	PER CENT OF BREADWINNERS IN POPULATION AT LEAST 10 YEARS OF AGE: 1900.				
	Total.	Single and unknown.	Married.	Widowed.	Divorced.
Continental United States:					
Male	80.0	66.4	94.2	77.1	89.3
Female	18.8	31.3	5.6	31.5	55.3

These figures show that in determining economic position marital condition is a much more important factor for women than for men. There are, to be sure, considerable differences between the per cents for single, married, and widowed males, but these arise rather from differences between the average age of the three classes than from alterations which marriage makes in a man's pecuniary standing. Thus the comparatively low per cent of breadwinners among single as compared with married men is probably due to the fact that over seven-tenths of the former and less than one one-hundredth of the latter are under 20 years of age. On the other hand, the fact that relatively fewer widowers than married men are breadwinners may be

explained on the ground that over one-third of the widowers as compared with one-thirteenth of the husbands are at least 65 years of age.

The differences in the per cents for women, on the contrary, are not of a kind that can be explained by differences of age. Instead of the per cent being highest for the married women in the prime of life, as it is for married men, and lower for the younger spinsters and the elder widows, it is nearly six times as high for single and widowed women as it is for wives. The difference is clearly due to the change which marriage makes in a woman's economic status. On marriage the woman, if she has a money-making occupation, in the great majority of cases exchanges it for domestic duties. But if her husband dies, she returns to work to win support for herself and, if she has children, for her family. Of the five or six cases in a hundred where the wife has a gainful occupation a considerable proportion is probably to be accounted for by the inability of the husband to work. There are, however, no data to show in how many cases both husband and wife act as breadwinners.

A point of peculiar interest brought out by the table is the very large proportion of divorced women who report themselves as engaged in gainful occupations. Probably all the census returns relating to divorced persons are incomplete, but in their present state the figures support the theory that the increase in the number of divorces is in large measure a result of the more independent economic position of women. The figures indicate that women who secure divorces are uncommonly well qualified to support themselves.

CITY AND COUNTRY.

An interesting side light is thrown upon the conditions affecting the frequency of remunerative employment of men and women by contrasting city and country. The occupation data are given separately only for the 78 cities having at least 50,000 inhabitants instead of for cities having at least 2,500 inhabitants. Therefore, what the figures for city and country show is the effect of the conditions of life that obtain in large cities, as compared with those in smaller cities or country districts, upon the opportunities for engaging in gainful occupations.

Sex and age.—Table IV shows the per cent of breadwinners in city and country with distinction of sex and age. It is to be regretted that the age classification of city breadwinners has been simplified to such a degree. The compression of the periods 10 to 15 and 16 to 24 into a single group interferes seriously with the study of a highly important subject—the employment of children in cities.

TABLE IV.—*Per cent of breadwinners in the total, male, and female population, classified by age periods, in cities having at least 50,000 inhabitants and in smaller cities or country districts: 1900.*

CITY OR COUNTRY, AND SEX.	PER CENT OF BREADWINNERS IN POPULATION: 1900.					
	All ages.	10 to 24 years.	25 to 44 years.	45 to 64 years.	65 years and over.	Age unknown.
Continental United States:						
Cities having at least 50,000 inhabitants—						
Total	42.8	46.8	61.6	54.8	32.4	37.0
Male	65.1	59.8	97.1	93.6	63.1	41.5
Female	20.7	35.0	24.3	15.7	7.5	27.2
Smaller cities or country districts—						
Total	37.0	39.5	57.9	56.1	40.5	49.9
Male	60.1	59.3	96.2	93.4	69.4	66.2
Female	12.4	19.1	15.7	13.7	9.5	23.4

A considerably greater proportion of the people living in large cities than of people living elsewhere is shown by these figures to be engaged in gainful occupations. In round numbers the difference is between 43 and 37 per cent for the total population, 65 and 60 per cent for males, and 21 and 12 per cent for females. In other words, of the people of all ages 6 persons more in every 100 act as breadwinners in cities than elsewhere.

So considerable a difference merits careful examination. Does the excess of the city per cent indicate a corresponding difference in the chances of obtaining employment in the cities as compared with the country? Inspection of the per cents for the different age groups does not favor an affirmative answer—at least for males. In no age period is the per cent for cities appreciably higher than that for the country, while in the last age period, 65 years and over, the country per cent is much greater than the city. The similarity noted in the per cent gainfully employed in city and country at each age period suggests that a difference in age distribution may be responsible for the greater proportion of males gainfully occupied in cities.

The extension of the suggestion regarding age distribution, combined with data derived from the preceding analyses, may afford an explanation of the greater relative number gainfully employed in cities. It has been seen that young and old people engage in gainful occupations much less frequently than persons in the prime of life, and women of all ages less frequently than men. If examination showed that a larger proportion of the inhabitants of the cities than of the country were of middle age or that a smaller proportion were women, the higher per cent of breadwinners would be explicable. To test this suggestion the age and sex constitution of the urban and rural population is compared in Table V.

TABLE V.—*Per cent distribution, by age and sex, of the total population in cities having at least 50,000 inhabitants and in smaller cities or country districts: 1900.*

CITY OR COUNTRY, AND SEX.	PER CENT OF TOTAL POPULATION: 1900.						
	All ages.	Under 10 years.	10 to 24 years.	25 to 44 years.	45 to 64 years.	65 years and over.	Age unknown.
Continental United States:							
Cities having at least 50,000 inhabitants—							
Total	100.0	20.6	28.3	33.8	13.7	3.3	0.3
Male	49.7	10.3	13.5	17.3	6.9	1.5	0.2
Female	50.3	10.3	14.8	16.5	6.8	1.8	0.1
Smaller cities or country districts—							
Total	100.0	24.7	30.7	26.3	13.7	4.3	0.3
Male	51.5	12.5	15.5	13.8	7.3	2.2	0.2
Female	48.5	12.2	15.2	12.5	6.4	2.1	0.1

Two facts which have directly opposite effects upon the proportion of breadwinners are brought out by this comparison. On the one hand, there are in the cities relatively fewer both of young and of old persons—a fact which favors a high per cent of persons in gainful occupations to total population; but, on the other hand, the women outnumber the men in the cities, while in the country the reverse is true—a fact which favors a low per cent. The problem still remains, then, to determine the net effect of these opposite differences in the age and sex constitution of the two populations.

A solution is found by computing how many of the 16,917,685 persons living in cities having at least 50,000 inhabitants in 1900 would have been of each sex and at each of the six age groups if the sex and age proportions prevailing in smaller cities or country districts had prevailed in the cities. Each one of this series of hypothetical numbers is then multiplied by the per cent of persons in gainful occupations in cities, actually found for that sex and age in the cities in question and shown in Table IV. The sum of these products, 6,855,013, represents the number of persons in the cities who would have been reported as having gainful occupations on the assumption that the sex and age composition of the city and country population had been identical, but the proportion of breadwinners at each age and of each sex had been that found by observation. In other words, this process eliminates the differences between city and country due solely to difference of age and sex composition between the two populations, and thereby makes obvious other differences partly or entirely masked by the crude figures. The result shows that, had there been no difference between the two populations in age and sex constitution, 40.5 per cent of the people living in cities would have had gainful occupations. The corresponding per cents for males and females are 60.1 and 19.7. The difference between these per cents and those given in Table IV are 2.3, 5.0, and 1.0, respectively, for both sexes, for men, and for women. These differences measure the net influence of the greater proportion of adults and the smaller proportion of males in the cities.

But even when the effect of these factors has been eliminated the proportion of breadwinners still remains higher in the cities. The reconstructed per cents for the city compare with the per cents for the country as follows:

CITY OR COUNTRY.	PER CENT OF BREADWINNERS IN POPULATION.		
	Total.	Male.	Female.
Continental United States:			
Cities having at least 50,000 inhabitants[1]	40.5	60.1	19.7
Smaller cities or country districts	37.0	60.1	12.4

[1] Adjusted figures.

From these figures it is clear that of two populations of identical constitution relatively more members engage in gainful occupations under city than under country conditions. The difference occurs solely among women, the per cents of men at work in city and country being the same; and, as reference to the per cents for the several age periods given in Table IV shows, it is more marked in the case of young persons than of adults. Indeed, attention has already been called to the fact that at the last age period, 65 years and over, the proportion of males at work is larger in the country (69.4 per cent) than in the city (63.1 per cent). One explanation of the relatively greater number of men in the cities who give up work as old age comes on, is probably that more city men acquire a competence early in life and retire to enjoy it at leisure. But conjoined with this is the effect of a difference in the nature of the predominant industries. A farmer can continue to direct his affairs even at a very advanced age and is not likely to regard himself as superannuated. Mechanical work and even unskilled labor, on the other hand, require steadiness of hand, muscular strength, and endurance. As these qualities begin to fail with the approach of age, artisans and mechanics find it difficult to secure employment in competition with younger and more vigorous men, and so are gradually forced into retirement. This is shown by the fact that men 65 years of age and over form 6.1 per cent of all males engaged in agriculture, but only 3.5 per cent of all males engaged in manufacturing and mechanical occupations.[1]

The greater frequency of gainful occupations in the age period 10 to 24 years presents a problem of much interest; but study of it is hindered by the insufficient specification of ages. It is commonly believed that more children enter economic life in the cities than in the country; but the census returns show that children 10 to 15 years of age form a larger proportion of the agricultural than of the professional, trading, domestic,

[1] Twelfth Census, Report on Occupations, Table XL.

or manufacturing breadwinners. The present figures throw little light upon the subject. All that they show is that for the whole fifteen-year period, from 10 to 24 years, 73 more persons in 1,000 of the inhabitants of large cities have gainful occupations than of people living in smaller cities or country districts, and that the excess in the case of males is only 5 in 1,000, but in that of females it is 156 in 1,000.

Rather more can be learned concerning the greater employment of women in cities. The excess of the urban per cents which is most marked in the first period, decreases gradually and in the last period a slight deficiency appears. A ready explanation for the higher per cents is found in the wider range of business opportunities opened to women by the diversified industries of the city than by the extractive industries dominant elsewhere.

Marital condition of females.—Added definiteness is given to our information by carrying out the analysis according to marital condition for women in city and country. This is done in Table VI with such fullness as the data allow.

TABLE VI.—*Per cent of breadwinners in female population, classified by marital condition, in cities having at least 50,000 inhabitants and in smaller cities or country districts: 1900.*

CITY OR COUNTRY.	PER CENT OF BREADWINNERS IN FEMALE POPULATION AT LEAST 10 YEARS OF AGE: 1900.				
	Total.	Single and unknown.	Married.	Widowed.	Divorced.
Continental United States:					
Cities having at least 50,000 inhabitants	26.0	46.6	5.8	28.7	59.0
Smaller cities or country districts	16.6	26.2	5.5	32.6	54.3

The difference between city and country is most marked in the case of single women—a fact which agrees well with the point to which attention was just called, that when the figures are analyzed by age the greatest excess of the urban over the rural per cents is for the period 10 to 24 years. But there is also an excess of the urban per cent for the other classes, except widows. The fact that fewer women who have lost their husbands engage in gainful occupations in the large cities than in the smaller cities or country districts, may perhaps be explained on the ground that a widow whose deceased husband was a farmer can better take up his occupation or find other employment than a widow in a city can take up her late husband's work or find another occupation.

In conclusion, it may be suggested that the higher per cent of female breadwinners in cities explains, at least in large measure, the fact that in cities women outnumber the men, though in the country as a whole there are more men than women. By the following comparison of the constitution of the city and country female population, color is lent to the suggestion that the magnet which attracts women to the cities is the opportunity of securing remunerative employment.

TABLE VII.—*Per cent distribution, by marital condition, of the female population at least 10 years of age in cities having at least 50,000 inhabitants and in smaller cities or country districts: 1900.*

CITY OR COUNTRY.	PER CENT OF FEMALE POPULATION AT LEAST 10 YEARS OF AGE: 1900.			
	Single and unknown.	Married.	Widowed.	Divorced.
Continental United States:				
Cities having at least 50,000 inhabitants	42.9	45.6	11.1	0.4
Smaller cities or country districts	40.5	49.9	9.2	0.4

This shows that single women, who are shown by Table VI to be most generally dependent upon their own efforts for support, are more numerous in cities, and that on the other hand there are relatively fewer women in cities who have husbands to maintain them. The larger per cent of widows in the city is probably due less to any economic cause than to the well-known fact that for adult years the excess of the male over the female death rate is greater in cities than in the country,[1] and also to the fact that in the country relatively more widows remarry. The relatively small number of divorced women reported in cities is regarded as indicating little else than the inaccuracy of the returns.

RACE AND NATIVITY.

Total population.—All of the results developed in the preceding discussions may be utilized in explaining the differences that exist between the per cent of breadwinners in the population for the four classes into which the Census divides the people, viz: (1) White persons born in the United States of native parents, (2) white persons born in the United States one or both of whose parents were born abroad, (3) foreign born whites, and (4) non-Caucasian persons, including, besides all persons of negro descent, Indians, Chinese, and Japanese. The per cents of breadwinners in population for these classes are as follows:

RACE AND NATIVITY.	Per cent of breadwinners in population: 1900.
Native white—native parents	33.9
Native white—foreign parents	33.9
Foreign born white	56.2
Negro, Indian, and Mongolian	45.3
Negro	45.2

Curiously enough, for the two most nearly related classes—white immigrants and native whites of foreign parentage—the difference between the per cents is a maximum. In every 1,000, 223 more of the foreign born whites than of their children are engaged in gain-

[1] A. F. Weber, The Growth of Cities in the Nineteenth Century, New York, 1899, pages 325 and 358 et seq.

ful occupations. This wide difference can hardly be ascribed to any other cause than differences in age and perhaps in the proportion of the sexes among the two classes. The great dissimilarity, from this point of view, in the constitution of the four classes is shown in Table VIII.

TABLE VIII.—PER CENT DISTRIBUTION, BY AGE AND SEX, OF THE POPULATION, CLASSIFIED BY RACE AND NATIVITY: 1900.

AGE PERIOD.	PER CENT OF POPULATION: 1900.											
	Total.		Native white—native parents.		Native white—foreign parents.		Foreign born, white.		Negro, Indian, and Mongolian.		Negro.	
	Male.	Female.	Male.	Female.	Male.	Female.	Male.	Female.	Male.	Female.	Male.	Female.
Continental United States:												
All ages	51.1	48.9	50.9	49.1	50.1	49.9	54.0	46.0	50.2	49.8	49.7	50.3
Under 10 years	12.0	11.8	13.2	12.8	15.2	15.0	1.0	1.0	13.5	13.6	13.6	13.7
10 to 24 years	15.1	15.1	15.6	15.4	16.9	17.2	8.7	8.9	16.7	17.4	16.8	17.7
25 to 64 years	21.8	19.9	19.8	18.7	17.5	17.2	39.3	31.6	18.2	17.0	17.5	17.2
65 years and over	2.0	2.0	2.1	2.1	0.5	0.5	4.8	4.4	1.5	1.5	1.5	1.4
Age unknown	0.2	0.1	0.2	0.1	(1)	(1)	0.2	0.1	0.3	0.3	0.3	0.3

[1] Less than one-tenth of 1 per cent.

The foreign born white population, as the table shows, consists more largely of adult males and less largely of children than any other class; while, conversely, adults are fewest and children most numerous among the native whites of foreign parentage. The other two classes vary less from the figures for the aggregate population. The chief differences are that both have relatively more children under 10 years of age than the aggregate population, while the native whites of native parents have relatively more and the non-Caucasians relatively fewer persons of advanced age.

That these differences—particularly those between the white immigrant population and their native born children—help to explain the variations in the per cents of breadwinners is clear; but to ascertain whether or not this explanation is complete, it is necessary to apply the method described in the preceding discussion for eliminating the effect of unlike age and sex constitution upon the proportion of persons engaged in gainful occupations. This has been done by calculating what would be the number and per cent of breadwinners in each of these classes if the age and sex composition of each was identical with that of the total population of continental United States. The results are presented as follows:

RACE AND NATIVITY.	PER CENT OF BREADWINNERS IN POPULATION: 1900.					
	Total.		Male.		Female.	
	Before adjustment.	After adjustment.	Before adjustment.	After adjustment.	Before adjustment.	After adjustment.
Continental United States:						
Native white—native parents	33.9	35.7	57.3	60.4	9.6	9.9
Native white—foreign parents	33.9	38.2	52.5	60.1	15.2	15.3
Foreign born white	56.2	40.0	88.1	61.0	18.7	18.0
Negro, Indian, and Mongolian	45.3	48.3	61.3	65.5	29.1	30.3
Negro	45.2	48.7	61.0	65.9	29.6	30.8

These figures make it clear that while the differences in the per cent of breadwinners in population are due in large measure to the unlike proportions of males and females and of adults and children, there must be also other causes at work. For, after the elimination of the differences in age and sex constitution, there still remain considerable variations in the per cent for the different classes. The search for the "other causes" from which these variations arise may best be conducted by turning from the per cent for persons of all ages to the per cent for persons belonging to the several age periods.

But before leaving the present figures attention should be called to two significant facts brought out by them. One is that the differences between the proportion of women of the four classes who engage in gainful occupations are considerably more marked than the corresponding differences for men. The other fact concerns the rank of the classes in respect to the per cent of breadwinners. For males and females alike the per cent of persons who engage in some remunerative occupation is highest among the non-Caucasian population, next highest among the white immigrants, and, except for males, next among their children, and lowest among native whites of native parentage. It is a commonly observed fact that the number of members of a family who attempt to earn money depends generally upon the family's pecuniary standing. If the family is in easy circumstances, the father is likely to be the sole breadwinner, while the mother confines herself to domestic cares, and the children are kept in school. If, on the contrary, the family is poor, the mother finds it necessary to add her endeavors to those of her husband, and the children are taken from school at an early age to be put to work where they can add something to the meager income of the household. The figures substantiate this observation, for the order of the four classes in respect to their per cent of breadwinners is, unless

the prevalent impression upon this subject is entirely erroneous, the inverse of their order in respect to economic well-being. The non-Caucasian population is thought to be the least well to do of the classes, and the largest proportion of its members, both men and women, are earning their own living in whole or in part. At the other extreme stand the whites of native parentage among whom economic welfare is thought to be most widely diffused. For them the per cents are lowest. Between these two classes is the immigrant population of the first and second generations. There is a general belief that the latter are rather better off than the newly arrived immigrants, because longer residence in the United States has given them opportunities to make moderate accumulations. Accordingly the per cent of breadwinners is lower for each sex among the native born children of foreigners than among the foreigners themselves.

So far as these figures enable us to judge, the parallelism between economic well-being and the proportion of the population who are earning money holds in every particular; but further analysis by sex and age periods, marital condition, and city residence shows that other factors also affect the result.

The material for the analysis by sex and age periods is given in Table IX.

TABLE IX.—*Per cent of breadwinners in male and female population, classified by race and nativity and age periods: 1900.*

SEX AND AGE PERIOD.	PER CENT OF BREADWINNERS IN POPULATION. 1900.				
	Native white—native parents.	Native white—foreign parents.	Foreign born white.	Negro, Indian, and Mongolian.	Negro.
Continental United States:					
Male—					
10 to 15 years	24.3	16.9	29.2	48.6	49.3
16 to 20 years	72.7	78.2	88.2	84.8	85.6
21 to 24 years	92.4	93.2	95.6	93.1	93.6
25 to 34 years	96.2	96.3	97.3	95.1	95.4
35 to 44 years	96.1	96.8	97.4	96.2	96.5
45 to 54 years	95.0	95.6	96.0	96.6	97.0
55 to 64 years	90.0	88.7	88.8	94.9	95.5
65 years and over	69.6	67.1	62.1	84.0	84.9
Age unknown	48.8	75.3	80.6	73.5	75.1
Female—					
10 to 15 years	5.7	7.9	20.3	30.1	30.6
16 to 20 years	20.8	40.0	56.8	48.8	49.6
21 to 24 years	21.3	37.8	41.5	45.0	45.6
25 to 34 years	13.9	22.5	19.8	41.1	41.8
35 to 44 years	11.6	15.0	13.0	40.9	41.6
45 to 54 years	11.5	12.8	11.7	41.5	42.2
55 to 64 years	11.2	11.6	9.8	40.1	41.0
65 years and over	7.8	7.7	6.2	27.8	28.5
Age unknown	15.2	25.1	26.3	35.5	38.3

Inspection of these figures shows that the differences in the per cents are chiefly differences in the frequency of the employment of children, women, and old men. The proportion of middle-aged males (25 to 54 years) at work is remarkably uniform for all of the classes. Since the relative number of retirements from active business life varies considerably in the several classes, the per cents for the years after 54 show increasing divergencies, and divergencies which do not altogether agree with the hypothesis of the connection between economic welfare and the number of breadwinners. There is no difficulty in accounting for the fact that the largest number of men continuing at work is found among the non-Caucasian population, for probably few non-Caucasian men succeed in acquiring competencies sufficient to enable them to spend their old age in leisure. But the next largest numbers are not among the foreign born, but among the whites of native parentage. This is probably to be explained in the same manner as the lower urban per cents for the same periods, namely, by differences in the nature of the occupations in which the several classes are most largely engaged. It has been argued (page 443) that mechanical occupations are as a rule more taxing upon muscular and nervous strength than farming, and, therefore, that men employed in them are more frequently compelled to give up work as their powers commence to fail with the approach of age. Confirmation of this inference may be obtained in the present case. The following figures show what proportions of the male breadwinners of the three classes of whites, who are engaged in agricultural and in manufacturing and mechanical occupations, are 55 to 64 years of age and 65 years of age and over:

TABLE X.—*Per cent 55 to 64 years of age and 65 years of age and over among white males of specified age and nativity engaged in agricultural and in manufacturing and mechanical pursuits: 1900.*

NATIVITY.	WHITE MALES AT LEAST 10 YEARS OF AGE ENGAGED IN AGRICULTURAL PURSUITS: 1900.		WHITE MALES AT LEAST 10 YEARS OF AGE ENGAGED IN MANUFACTURING AND MECHANICAL PURSUITS: 1900.	
	Per cent 55 to 64 years of age.	Per cent 65 years of age and over.	Per cent 55 to 64 years of age.	Per cent 65 years of age and over.
Area of enumeration:				
Native white—native parents	8.9	6.0	7.7	4.3
Native white—foreign parents	4.1	2.0	2.7	0.9
Foreign born white	17.1	12.1	9.5	4.3

Of course, the relative size of the per cents for the three nativity classes points merely to the unlike age constitution of the classes, but when each class is considered by itself it is seen that the proportion of males 55 to 64 or 65 and over engaged in mechanical occupations is smaller in every case than the corresponding proportion for agriculture. Since this difference is common to all the classes, it seems fair to conclude that the proportion in which men of advanced age give up work depends rather upon the kind of occupations in which they are engaged than upon a special fondness of aged immigrants for leisure and of aged Americans for labor.

The same explanation can be applied to the high per cent of breadwinners among non-Caucasian males 55 to 64 and 65 years of age and over. Not only are many negroes of advanced years dependent upon continuous labor for subsistence, but their prevailing agricultural

occupations are also of a kind that can be conducted with some success by men past the prime of life.

Though the variations in the per cent of male bread winners in the last two age periods are considerable, they are, on the whole, not so great as the differences in the first three. The variations here agree in general with the hypothesis of the dependence of the proportion of workers upon economic condition. Well to do people do not find it necessary to supplement the family income by putting their children to work at an early age. On the contrary, they prefer to give their sons and daughters an education, which makes them more efficient as workers but which delays their entrance upon active business life. Accordingly, some light is thrown upon these variations of the per cents by contrasting the proportions of boys and young men who have gainful occupations with the proportions of the same persons who attend school. The two sets of per cents are brought together in Table XI.

TABLE XI.—*Per cent attending school and per cent engaged in gainful occupations in male population, classified by race and nativity and age periods: 1900.*[1]

RACE AND NATIVITY.	PER CENT OF MALE POPULATION—							
	Attending school: 1900.				Engaged in gainful occupations: 1900.			
	10 to 24 years.	10 to 14 years.	15 to 20 years.	21 to 24 years.	10 to 24 years.	10 to 15 years.	16 to 20 years.	21 to 24 years.
Continental United States:								
Native white—native parents	44.7	82.7	32.9	4.6	56.1	24.3	72.7	92.4
Native white—foreign parents	41.6	85.9	22.0	3.1	54.4	16.9	78.2	93.2
Foreign born white	17.1	73.4	8.3	1.7	78.0	29.2	88.2	95.6
Negro, Indian, and Mongolian	25.1	50.9	15.4	1.8	71.2	48.6	84.8	93.1
Negro	24.9	50.6	15.0	1.5	71.7	49.3	85.6	93.6

[1] In order to prepare this table it has been necessary to assume that the persons 21 years of age and over reported as attending school were all under 25. This assumption probably does little violence to the facts, because the number of persons older than this is small compared with the number younger.

Though the age periods for school attendance and for gainful occupations are not exactly comparable, this table shows what our hypothesis would lead us to expect, that in general the proportion of breadwinners among young people varies inversely as the per cent attending school. The comparatively small number of native white males of native or foreign parentage under the age of 25 who are engaged in gainful occupations, is seen to be connected with the fact that so many more of them than of youths of the other classes are in school. A similar explanation can be given of the fact that while more non-Caucasian children than foreign born white children find remunerative employment in the years 10 to 15, this relation is reversed in the succeeding period. The number of non-Caucasian children 10 to 14 years of age attending school is considerably smaller, but of those who do go to school a relatively much larger per cent continue to study after completing the fourteenth year. The young children of immigrants who live largely in states having compulsory education laws are apparently sent to school very generally, but as soon as the law allows, most of them are withdrawn by their parents and set to learning some trade or business.

Marital condition of females. The per cents for females, given in Table IX, show that in the first three periods the order of the four classes is substantially the same as in the case of males, and requires no further explanations than those already suggested. But after the age of 24 there is a much less decided decline in the per cent for non-Caucasian women than for any of the white classes. This, as the figures in Table XII show, is due simply to the fact that the number of women who continue to follow gainful occupations after their marriage is much larger among non-Caucasians than among whites.

TABLE XII.—*Per cent of breadwinners in female population at least 10 years of age, classified by race and nativity and marital condition: 1900.*

RACE AND NATIVITY.	PER CENT OF BREADWINNERS IN FEMALE POPULATION AT LEAST 10 YEARS OF AGE: 1900.			
	Single and unknown.	Married.	Widowed.	Divorced.
Continental United States:				
Native white—native parents	21.5	3.0	26.1	47.5
Native white—foreign parents	34.3	3.1	32.3	52.9
Foreign born white	60.9	3.6	20.7	51.4
Negro, Indian, and Mongolian	46.9	25.6	66.0	80.6
Negro	47.7	26.0	67.0	82.2

The figures seem to show conclusively the connection between the relatively poor economic position of the non-Caucasian population and the high per cent of breadwinners. Over one-fourth of the wives, about two-thirds of the widows, and over four-fifths of the divorced women have to take up some gainful occupation in order to help support themselves and their families.

It is also instructive to examine the proportion of breadwinners among the women belonging to the several classes in connection with the subject of residence. The proportion of women of each class living in cities is given in Table XIII.

TABLE XIII.—*Per cent of female population, classified by race and nativity, living in cities having at least 50,000 inhabitants: 1900.*

RACE AND NATIVITY.	Per cent of female population living in cities having at least 50,000 inhabitants: 1900.
Continental United States:	
Native white—native parents	13.4
Native white—foreign parents	39.7
Foreign born white	47.7
Negro, Indian, and Mongolian	10.5
Negro	10.7

The comparatively high per cents of breadwinners among the foreign born females and among the native born daughters of foreigners are easy to understand in the light of these per cents, and the discussion on pages 442 to 444, which shows that a much larger proportion of the women living in large cities than of the women living in smaller cities or country districts find remunerative occupations. It would be a mistake, however, to regard this explanation as in any degree invalidating or superseding the general theory of the dependence of the per cents upon economic well-being. Foreign born women and their daughters do not engage in gainful occupations more frequently than native women because more of them live in cities. It is probably because a greater number of the former have to find some means of supporting themselves, and the cities afford the most numerous openings.

This distinction is emphasized when we observe that the proportion of non-Caucasian women who live in cities is less than the proportion of any other class, and yet the proportion of breadwinners among them is greater. Economic necessity compels large numbers of non-Caucasian women to seek opportunities for earning money, but a much larger proportion of them than of white female breadwinners engage in agricultural occupations. For this reason they are not compelled to go to the cities for opportunities to work.

GEOGRAPHIC DIVISIONS.

States and territories.—Table XIV shows what proportion of the total population of each state and territory was engaged in gainful occupations in 1900.

In general, the per cents are high in the Northeastern and the Western states and low in the Central and Southern states. The maximum per cent, 47.8, is in Wyoming, and the minimum 30.6, in Utah. In the North Atlantic division Rhode Island leads, with 44.8 per cent, and Pennsylvania comes last, with 38.9 per cent. In the South Atlantic division only the District of Columbia and South Carolina have two-fifths of their population engaged in gainful occupations, the per cents being 45.5 for the former and 42.6 for the latter. In the South Central states the per cents run still lower, Alabama and Mississippi leading with 41.7 and 41.6, respectively. In the states of the northern Mississippi valley the average is about the same as that in the South Central division, though the range of variation is less. Finally, the Western states and territories have the highest per cents of all, Idaho, Utah, and New Mexico alone sinking below 40 per cent, and Montana, Wyoming, and Nevada having nearly half of their people engaged in gainful occupations.

The range of these variations is very wide, there being a difference of 17.2 between the maximum per cent in Wyoming and the minimum in Utah. To account for the great differences it is again necessary to make use of the results of the preceding analysis.

TABLE XIV.—*Number and per cent of breadwinners in total population, for states and territories: 1900.*

STATE OR TERRITORY.	Total population: 1900.	BREADWINNERS: 1900.	
		Number.	Per cent.
Continental United States	75,994,575	29,073,233	38.3

California	1,485,053	644,267	43.4

Main geographic divisions.—The unlike age and sex constitution of the populations of the states explains some of the most striking contrasts. In investigating the effect of this factor upon the per cents it will be convenient, in order to avoid the confusion arising from multiplicity of detail, to deal with the five groups of states rather than with the states themselves. There is less objection to this method of procedure because the main geographic divisions correspond in a general way to the characteristic differences in the age and sex constitution of the population. The data are given in Table XV.

TABLE XV.—PER CENT DISTRIBUTION, BY SEX AND AGE PERIODS, OF THE TOTAL POPULATION, FOR MAIN GEOGRAPHIC DIVISIONS: 1900.

SEX AND DIVISION.	PER CENT OF TOTAL POPULATION: 1900.									
	All ages.	Under 10 years.	10 to 15 years.	16 to 24 years.	25 to 34 years.	35 to 44 years.	45 to 54 years.	55 to 64 years.	65 years and over.	Age unknown.
Male.										
Continental United States	51.1	12.0	6.4	8.7	8.2	6.4	4.5	2.7	2.0	0.2
North Atlantic division	50.0	10.4	5.4	8.2	8.9	7.0	4.7	3.0	2.3	0.1
South Atlantic division	50.0	13.6	7.2	9.1	6.9	5.1	3.9	2.3	1.7	0.2
North Central division	51.6	11.6	6.4	8.7	8.3	6.7	4.6	2.9	2.3	0.1
South Central division	51.0	14.3	7.4	9.3	7.2	5.0	4.0	2.1	1.5	0.2
Western division	56.2	10.6	5.6	8.6	10.2	9.3	5.8	3.3	2.3	0.5
Female.										
Continental United States	48.9	11.8	6.3	8.9	7.7	5.7	3.9	2.5	2.0	0.1
North Atlantic division	50.0	10.3	5.4	8.7	8.7	6.6	4.6	3.1	2.5	0.1
South Atlantic division	50.0	13.4	7.0	9.6	7.0	5.1	3.7	2.3	1.8	0.1
North Central division	48.4	11.3	6.3	8.6	7.7	5.8	3.9	2.6	2.1	0.1
South Central division	49.0	13.8	7.2	9.5	6.9	4.7	3.4	1.9	1.4	0.2
Western division	43.8	10.3	5.5	7.6	7.5	5.7	3.5	2.1	1.5	0.1

Regarding sex, the table shows that the numbers of men and of women in the North and South Atlantic states are equal, but that there are more men than women in the North and South Central and Western divisions. The disparity of the sexes, however, is not very great except in the West, where about 5 persons in every 9 are males. Of children under 10 years of age, on the other hand, there are relatively most in the South Central division and fewest in the North Atlantic. Even in the Western states, which still retain something of the frontier character, the proportion of children is slightly higher than in the North Atlantic division. Finally, the three divisions in the North and West have considerably more men 65 years of age and over than the two divisions in the South.

To ascertain to what extent these variations in the age and sex constitution explain the differences in the per cent of breadwinners, it is necessary to resort again to the method of adjustment explained on page 443, and calculate what would be the number of breadwinners in each group of states were their populations all constituted as to sex and age in the same manner as is the population of continental United States as a whole. The results of this calculation are given in the following statement:

DIVISION.	PER CENT OF BREADWINNERS IN POPULATION: 1900.					
	Total.		Male.		Female.	
	Before adjustment.	After adjustment.	Before adjustment.	After adjustment.	Before adjustment.	After adjustment.
North Atlantic	40.8	38.6	64.0	60.2	17.5	16.1
South Atlantic	38.3	41.4	59.2	63.8	17.4	17.9
North Central	36.4	35.7	60.2	59.3	11.0	11.0
South Central	37.0	40.1	59.0	64.3	14.1	14.9
Western	41.6	35.4	65.5	58.8	11.1	10.9

These figures show how different is the rank of the five main divisions in the order of the proportion of breadwinners before and after correction has been made for the differences in age and sex composition of the population. The order of the several divisions, beginning with the highest per cent of breadwinners, was as follows:

BEFORE ADJUSTMENT.		AFTER ADJUSTMENT.	
Division.	Per cent.	Division.	Per cent.
Western	41.6	South Atlantic	41.4
North Atlantic	40.8	South Central	40.1
South Atlantic	38.3	North Atlantic	38.6
South Central	37.0	North Central	35.7
North Central	36.4	Western	35.4

The process of adjustment increases the range of variation from 5.2 to 6.0, and entirely rearranges the order. When correction is made for the large proportion of children in the South, the two southern divisions, instead of ranking third and fourth, rank first and second in the proportion of breadwinners. When correction is made for the large proportion of adult males in the West, that division, instead of ranking first, ranks last in the proportion of breadwinners.

While this process of adjustment completely rearranges the order of the divisions, it does not explain the differences between them. It simply makes the problem more precise, by removing certain elements which obscured it. For the total population the range of variation is increased 0.8—that is, from 5.2 to 6.0; for the male population it is reduced 1.0—that is, from 6.5 to 5.5; and for the female population it is increased 0.5—that is, from 6.5 to 7.0. These differences are due to variations in the proportion of persons of given age and sex who engage in gainful occupations. To ac-

count for them, therefore, it is necessary to examine the per cent of breadwinners in the population, classified by sex and age periods. These per cents are given in Table XVI.

TABLE XVI.—PER CENT OF BREADWINNERS IN MALE AND IN FEMALE POPULATION, CLASSIFIED BY AGE PERIODS, FOR MAIN GEOGRAPHIC DIVISIONS: 1900.

SEX AND DIVISION.	PER CENT OF BREADWINNERS IN MALE AND IN FEMALE POPULATION: 1900.								
	All ages.	10 to 15 years.	16 to 24 years.	25 to 34 years.	35 to 44 years.	45 to 54 years.	55 to 64 years.	65 years and over.	Age unknown.
Male.									
Continental United States	61.2	26.1	83.9	96.3	96.6	95.5	90.0	68.4	59.6
North Atlantic division	64.0	17.1	85.5	96.9	95.9	95.2	89.3	66.6	50.4
South Atlantic division	59.2	41.6	85.2	95.6	96.6	96.1	92.9	78.1	67.4
North Central division	60.2	17.0	82.0	96.2	96.9	94.9	87.9	62.5	55.5
South Central division	59.0	42.7	85.3	96.0	96.8	96.8	94.3	79.6	70.5
Western division	65.5	10.9	80.4	96.1	96.7	95.8	90.6	71.8	58.7
Female.									
Continental United States	14.3	10.2	31.6	19.9	15.6	14.7	13.2	9.1	24.2
North Atlantic division	17.5	9.6	43.7	24.5	16.9	14.0	11.6	7.1	26.3
South Atlantic division	17.4	18.5	31.0	23.3	22.5	22.5	21.4	16.1	29.4
North Central division	11.0	4.9	28.1	15.6	10.6	9.7	9.1	6.2	18.3
South Central division	14.1	15.1	23.5	18.9	19.3	20.8	20.6	16.1	27.2
Western division	11.1	2.7	23.2	16.8	13.7	14.0	12.4	8.2	15.4

Commencing with the first age period, it is seen that employment of children is much more common in the Southern states than elsewhere. This is due to the presence of so many negroes. Table IX (page 446) shows that the proportion of children 10 to 15 years of age engaged in gainful occupations is much higher among the non-Caucasians than among any other element of the population. Almost one-third of the people in the southern divisions are negroes, while in the other divisions they nowhere amount to one-fiftieth of the population.

In the second age period, 16 to 24 years, the highest per cents for both men and women are found in the North Atlantic states. An explanation of this fact also is suggested by the previous study. In comparing the per cent of breadwinners in cities having at least 50,000 inhabitants with the per cent for the smaller cities or country districts (page 442), the most striking difference noticed was the excess of the city per cent over the country per cent in the earlier age periods, particularly the years 10 to 24. The per cents were 46.8 in the cities and 39.5 in the country for the total; 59.8 and 59.3, respectively, for males; and 35.0 and 19.4, respectively, for females. This difference is significant for the present purpose, because the North Atlantic states have a much larger proportion of their population in cities having at least 50,000 inhabitants than any other section of the country, as appears clearly from Table XVII.

TABLE XVII.—*Per cent of population living in cities having at least 50,000 inhabitants, for main geographic divisions: 1900.*

DIVISION.	Per cent of population living in cities having at least 50,000 inhabitants: 1900.
North Atlantic	42.8
Western	21.3
North Central	19.6
South Atlantic	11.0
South Central	5.2

A second factor, closely related to the first, which helps to explain the excess of the North Atlantic per cents over those for the Southern states in the age period, 16 to 24 years, is the greater proportion of the foreign born whites. While more non-Caucasian than foreign born children are at work at ages 10 to 15, this relation is reversed at ages 16 to 24. This foreign born white class constitutes over one-fifth of the population of the North Atlantic division, but only about one-fiftieth of that of the Southern states.

The per cents for males in the three succeeding periods show surprisingly small variations. Attention has already been called to the evenness of the per cents for these years. There are few social uniformities discovered by the Census that hold with greater regularity than the proportion of men in the prime of life engaged in gainful occupations. Whether the population is analyzed by city and country residence, by race and nativity, or by geographical distribution makes almost no difference. In any case, only about 3 or 4 men in 100 of this age are found to have no occupation.

After 54, about which age men commence to retire from active business life with some frequency, differences in the per cents reappear. The decline is most rapid in the Northern and least rapid in the Southern states. Again, the explanation is found in the large non-Caucasian population of the South, for it was shown in Table IX that the number of men who continue to work after passing 54 is much larger among the non-Caucasians than among any of the white classes.

Taking up, finally, the figures for women over 24 years of age, we observe that the per cent of breadwinners in the population in every period is lowest in the North Central states. As compared with the Southern states, this may be ascribed to the small number of non-Caucasian women, and as compared with the North Atlantic states, to the smaller per cent of population in the cities, and the dominance of agriculture, which offers fewer opportunities than manufacturing for the

employment of female labor. Though agriculture plays an even larger rôle in both groups of Southern states, the proportion of women who have gainful occupations there is, on the whole, larger than anywhere else. This is due simply to the fact that non-Caucasian women labor in the fields more commonly than white women. The large city population and the development of manufacturing account for the fact that the North Atlantic states, as a whole, stand next to the southern divisions. Finally, the per cents for the Western states, generally speaking, lie between those for the North Atlantic and North Central divisions.

Specified states and territories.—So far the examination has been confined to the average proportion of breadwinners in the population of the five groups of states. Table XIV, however, shows that there are wide variations between the per cents for the several states within each group. The preceding study requires to be supplemented, therefore, by an inquiry into the causes of some of the more striking of these differences. The problem arises, for example, why 44.8 per cent of the people of Rhode Island are engaged in gainful occupations and only 38.9 per cent in the state of Pennsylvania in the same division (page 448). To come to close quarters with the problem, it is necessary to break up the per cents for the whole population into per cents for the sexes and for age groups.

TABLE XVIII.—*Per cent of breadwinners in male and in female population, classified by age periods, for Rhode Island and Pennsylvania: 1900.*

SEX AND STATE.	PER CENT OF BREADWINNERS IN MALE AND IN FEMALE POPULATION: 1900.								
	All ages.	10 to 15 years.	16 to 24 years.	25 to 34 years.	35 to 44 years.	45 to 54 years.	55 to 64 years.	65 years and over.	Age unknown.
Male:									
Rhode Island	66.4	23.2	89.2	97.2	97.1	95.2	88.7	63.7	40.4
Pennsylvania	62.9	22.4	86.1	96.5	96.8	95.6	89.9	66.6	54.0
Female:									
Rhode Island	23.9	17.4	58.5	33.0	22.3	16.8	12.5	6.9	34.5
Pennsylvania	13.9	9.7	35.4	18.8	12.9	11.0	9.8	6.7	23.7

These figures show that the difference between the per cents for the two states affects only the per cents for women and children. For men beyond the age of 24 there is a practical agreement. But of males under 24 and of females of all ages, relatively more find work in Rhode Island than in Pennsylvania. This is due doubtless to the difference in the nature of the prevailing industries of the two states. The textile mills of Rhode Island afford more opportunities for the employment of women and children than do the mines and steel works of Pennsylvania. Differences in the age and sex constitution of the two populations also have some effect upon the per cents, though in a measure they counteract each other. Rhode Island has relatively more women, but also relatively fewer children. The per cent of women in the total population of the two states is 50.9 and 49.2, respectively; that of children under 10 years of age, 19.5 and 22.5. The latter difference outweighs the former and helps to explain the high per cent of breadwinners in Rhode Island. Of the remaining North Atlantic states—New Hampshire, Massachusetts, and Connecticut—in character of industry and constitution of population, approach the type of Rhode Island and have a large proportion of their people at work, while the other states have rather more in common with Pennsylvania and consequently approach its per cent.

In the South Atlantic states still greater contrasts are to be found. The highest per cent, 45.5, is in the District of Columbia and the lowest, 34.0, in West Virginia. By sex and age periods the per cents are as follows:

TABLE XIX.—*Per cent of breadwinners in male and in female population, classified by age periods, for the District of Columbia and West Virginia: 1900.*

SEX, AND STATE OR TERRITORY.	PER CENT OF BREADWINNERS IN MALE AND IN FEMALE POPULATION: 1900.								
	All ages.	10 to 15 years.	16 to 24 years.	25 to 34 years.	35 to 44 years.	45 to 54 years.	55 to 64 years.	65 years and over.	Age unknown.
Male:									
District of Columbia	65.0	10.4	80.6	94.7	95.4	92.0	85.2	66.0	24.1
West Virginia	59.0	33.0	83.4	95.8	96.8	96.4	93.1	74.7	71.2
Female:									
District of Columbia	28.1	5.5	44.7	38.7	37.1	35.2	25.6	15.0	22.6
West Virginia	6.8	3.9	13.4	9.4	8.5	9.5	10.6	8.8	17.4

The proportion of men over 24 years of age living in the District of Columbia who have no gainful occupation is remarkably large, but nevertheless the per cent of breadwinners among males of all ages is considerably higher than in West Virginia. The explanation of this seeming anomaly is found in the age constitution of the male population. In West Virginia 26.3 per cent of all males are under 10 years of age, but in the District of Columbia only 17.7 per cent. Conversely, the men between 25 and 64 years of age—the years for which the per cents are highest—form 37.8 per cent of the male population in West Virginia and 50.8 per cent in the District of Columbia.

For women, on the other hand, the per cents of breadwinners at every age period are materially lower in West Virginia. Several factors contribute to this result. The District of Columbia is coextensive with the city of Washington, and it was shown (page 442) that more women find work in cities than in the country. Moreover, the departments of the Federal Government give employment to large numbers of women, there is a very large negro population, and the proportion of girls under 10 is low. These factors combine to make the per cent of females at least 10 years of age engaged in gainful occupations in the District of Columbia higher not only than in West Virginia, but higher also than in any other state or territory, except South Carolina.

It is fairer, however, to compare the per cents for the District of Columbia with the per cents for cities rather than with the per cents for states. When this comparison is made the proportion of females engaged in gainful occupations does not seem extremely high. A larger part of the women living in Manchester, Fall River, Lowell, Lawrence, New Bedford, Troy, Charleston, Atlanta, Savannah, and Memphis are earning money than of the women in Washington, while in Richmond the per cent is the same.

Of the states and territories of the South Atlantic and South Central divisions, with the exception of the District of Columbia, South Carolina has the highest per cent of breadwinners, and this in face of the fact that it also has more women than men and a larger per cent of children under 10 years of age than any other state or territory, except Indian Territory. The anomaly is explained in part by the fact that next to Mississippi it also has the largest per cent of negroes. In the other Southern states also the per cent of breadwinners varies in some agreement with the per cent of negro population. This is shown by the following table, in which the proportions both of breadwinners and of negroes in the population are given for each state:

TABLE XX.—*Per cent of breadwinners and of negroes in total population, for states and territories of the South Atlantic and South Central divisions: 1900.*

STATE OR TERRITORY.	TOTAL POPULATION: 1900.		
	Per cent of breadwinners.	Per cent of negroes.	Rank by per cent negro.
District of Columbia	45.3	31.1	9
South Carolina	42.6	58.4	2
Alabama	41.7	45.2	5
Mississippi	41.6	58.5	1
Delaware	39.5	16.6	14
Georgia	39.0	46.7	4
Louisiana	38.8	47.1	3
Maryland	38.6	19.8	13
Florida	38.1	43.7	6
North Carolina	37.8	33.0	8
Arkansas	37.0	28.0	10
Tennessee	36.0	23.8	11
Virginia	35.7	35.6	7
Kentucky	35.0	13.3	15
Indian Territory	34.1	9.4	16
West Virginia	34.0	4.5	18
Texas	33.9	20.4	12
Oklahoma	33.3	4.7	17

The District of Columbia, Delaware, and Maryland, having in comparison with the other states of the South a relatively high per cent of urban population and low per cent of children, and in general different economic conditions, do not follow the tendency toward parallelism between the per cent of breadwinners and the per cent of negroes in the total population. With the exception of these subdivisions, the states in general show that tendency. Such variations as occur among the states that have over 40 per cent of negroes in the total population are due for the most part to the relatively higher per cent of females employed in one state than in another. Among the remaining states, Virginia, West Virginia, and Texas form the exceptions. Virginia ranks seventh in per cent negro, but thirteenth in per cent of breadwinners, an explanation being found in the excess of females and the relatively large proportion (26.4 per cent) of children under 10 in this state. West Virginia, on the other hand, ranks sixteenth in per cent of breadwinners, but last among the eighteen states and territories in per cent negro, the relatively high rank in per cent of breadwinners being due to the fact that 52.1 per cent of the people of West Virginia are males. Texas ranks twelfth in per cent negro, but next to last in per cent of breadwinners, which is explained by the large proportion (29.0 per cent) of children under 10 in this state, outweighing the effect of an excess of males.

In the North Central states the per cents of breadwinners are more uniform. The extremes are 37.4 per cent in Illinois and in Michigan and 34.2 per cent in South Dakota. The sex and age constitution of the population in these states is shown in the following table:

TABLE XXI.—*Per cent of breadwinners in male and in female population, classified by age periods, for Illinois, Michigan, and South Dakota: 1900.*

SEX AND STATE.	PER CENT OF BREADWINNERS IN MALE AND IN FEMALE POPULATION: 1900.								
	All ages.	10 to 15 years.	16 to 24 years.	25 to 34 years.	35 to 44 years.	45 to 54 years.	55 to 64 years.	65 years and over.	Age unknown.
Male:									
Illinois	61.0	17.3	85.4	96.3	96.8	90.3	86.1	58.5	45.9
Michigan	61.8	13.1	82.4	96.3	97.1	96.4	90.8	67.9	57.2
South Dakota	56.2	20.5	76.3	93.9	94.9	93.6	87.4	61.8	56.8
Female:									
Illinois	12.5	6.7	32.2	17.6	12.1	10.3	8.8	5.6	17.0
Michigan	11.4	4.9	31.1	15.8	10.1	9.1	8.9	6.2	19.7
South Dakota	8.4	4.5	24.6	11.6	7.4	8.2	8.5	4.8	18.5

The table shows that the proportion of males at work in South Dakota is smaller than in Illinois only at the three age periods, 16 to 24, 25 to 34, and 35 to 44. The proportion is less in South Dakota than in Michigan, however, at every age period except the first, 10 to 15 years. Among females the per cent of breadwinners at every age period is less in South Dakota than in either Illinois or Michigan. The low rank of South Dakota in the per cent of breadwinners in the total population may be ascribed to the large proportion (26.7 per cent) of children under 10, and to the very small city population in the state, these factors overcoming the effect of a marked excess of males.

The most extreme variations between the per cents for states in the same section of the country are found in the West. In Wyoming 47.8 per cent of the population and in Montana 47.2 per cent of the population are engaged in gainful occupations, as compared with only 33.8 per cent of the population in New Mexico and 30.6 per cent of the population in Utah. The detailed figures for these four states are shown in Table XXII.

TABLE XXII.—*Per cent of breadwinners in male and in female population, classified by age periods, for Montana, Wyoming, New Mexico, and Utah: 1900.*

SEX, AND STATE OR TERRITORY.	PER CENT OF BREADWINNERS IN MALE AND IN FEMALE POPULATION: 1900.								
	All ages.	10 to 15 years.	16 to 24 years.	25 to 34 years.	35 to 44 years.	45 to 54 years.	55 to 64 years.	65 years and over.	Age unknown.
Male:									
Montana	70.1	8.1	84.5	96.6	96.4	95.2	91.7	73.6	63.6
Wyoming	70.9	16.4	87.3	97.7	98.3	96.7	93.4	76.4	68.2
New Mexico	57.3	22.6	78.1	93.4	95.1	95.3	92.8	76.2	76.8
Utah	52.1	10.6	75.9	96.0	96.7	96.7	93.1	70.9	44.4
Female:									
Montana	10.5	2.4	24.5	16.1	12.1	14.5	11.3	7.3	25.6
Wyoming	8.7	2.5	21.6	12.6	9.7	12.0	12.0	7.6	10.5
New Mexico	6.9	4.3	10.5	9.3	10.6	14.5	15.1	12.6	9.3
Utah	8.0	2.1	19.1	11.7	10.3	12.5	12.5	6.7	9.6

Inspection of these per cents suffices to show that while in general Montana and Wyoming have slight advantages over New Mexico and Utah in the proportion of men engaged in gainful occupations at the different age periods, and decided advantages in the proportion of women at the earlier age periods, these differences alone are not enough to explain the great variations in the per cents for both sexes and all ages. More important is the effect of the unlike age and sex constitution. In Wyoming 62.9 per cent of the population are males, and only 22.1 per cent are under 10 years of age. The corresponding per cents for Montana are 61.6 and 21.3, respectively. On the other hand, only 53.4 per cent of the population of New Mexico are males, and 27.7 per cent are children under 10 years of age, the corresponding per cents for Utah being 51.2 and 28.9, respectively.

Unlike age and sex constitution of the population explains also the variations in the per cents for the other Western states in much the same manner as the per cent of non-Caucasian population has been found to explain the variations in the per cents for the Southern states. In Table XXIII the Western states are arranged in the order of their per cent of breadwinners, while in two additional columns the proportions of the population who are males and children under 10 years of age are given.

TABLE XXIII.—*Per cent of breadwinners, of males, and of children under 10 years of age in total population, for states and territories in the Western division: 1900.*

STATE OR TERRITORY.	1900		
	Per cent of breadwinners in total population.	Per cent male in total population.	Per cent of children under 10 years of age in total population.
Wyoming	47.8	62.9	22.1
Montana	47.2	61.6	21.3
Nevada	46.8	60.5	17.4
Washington	43.5	58.7	21.2
Arizona	43.4	58.4	23.4
California	43.4	55.3	17.7
Oregon	41.0	56.3	20.5
Colorado	40.4	54.7	21.2
Idaho	38.7	57.7	25.9
New Mexico	33.8	53.4	27.7
Utah	30.6	51.2	28.9

From this table it can be seen how the two factors—the relative number of males and of children too young to work—combine to determine the place of the states in the scale. For example, California has relatively fewer men than Oregon, but it ranks higher in per cent of breadwinners because the proportion of children under 10 in its population is so very small. On the other hand Idaho, which ranks below all except New Mexico and Utah of the 11 states and territories, would stand much higher were it not for the handicap of a relatively large number of children.

COMPARISONS, 1900, 1890, 1880, AND 1870.

It is a matter of much interest to know whether the number of persons in the United States who are supporting themselves wholly or in part is increasing or decreasing. Statistical investigation of this subject is limited to a comparatively short period of time by lack of data. An attempt to collect occupation statistics in connection with the census was made as long ago as 1820, but the inquiries then related only to persons engaged in three branches of industry—agriculture, commerce, and manufactures. At the next census the matter was dropped entirely, and when it was revived in 1840 the only change from the plan of 1820 was the addition of four other kinds of work—mining, navigation of the high seas, navigation of inland waters, and the learned professions. In 1850 all occupations were recognized as at present, but the figures were given only for free males over 15 years of age. The same plan was followed in 1860, except that the two sexes were not distinguished in the tables. It was thus not until 1870 that the statistics were gathered both for all occupations and for all persons 10 years of age and over. Consequently, the results that have been derived from the Twelfth Census can be compared with similar material from the censuses of 1890, 1880, and 1870 only.

Total population.—The first comparison to be made is between the per cent of breadwinners in total population, as reported at the four censuses. The data are given in Table XXIV.

TABLE XXIV.—*Number and per cent of breadwinners in total population: 1900, 1890, 1880, and 1870.*

CENSUS.	Total population.	BREADWINNERS.	
		Number.	Per cent.
Continental United States:			
1900	75,994,575	29,073,233	38.3
1890	62,622,250	[1] 23,318,183	[1] 37.2
1880	50,155,783	17,392,099	34.7
1870	38,558,371	12,505,923	32.4

[1] Corrected figures; see explanation in Twelfth Census, Report on Occupations, page lxvi.

From these figures it appears that the growth in the number of breadwinners has been more rapid than the growth of population, so that the proportion of the people engaged in gainful occupations has increased.

Nearly six persons more in every hundred were earning money for themselves in 1900 than in 1870.

In seeking to localize this increase and determine its cause, the first step is to examine the sex and age constitution of the population in 1900, 1890, 1880, and 1870. The preceding discussions have shown abundantly that if any considerable change has taken place in this respect, it must have influenced the per cent of breadwinners. The investigation of the effect of such changes as may have occurred can not, however, be made so exactly as before. This is because of the new age classification of breadwinners introduced in 1890. Before then but three groups had been recognized—10 to 15 years, 16 to 59 years, and 60 years and over. The new lines of division drawn in 1890 did not in any case coincide with the old. The first age period was 10 to 14 instead of 10 to 15, the last was 65 and over instead of 60 and over, and the intermediate years were split up into six groups, of which the first was 15 to 19 and the last 55 to 64. In 1900 the first age period was again 10 to 15 years, as in 1870 and 1880, figures being given also by single years for this group alone. The second age period of 1900 was 16 to 24 years, which had never before been shown, while those following were the same as in 1890. For these reasons comparison between the per cents of the different age groups is impossible, and we must content ourselves with using the whole male and female population at least 10 years of age as a basis. Accordingly, in the following table the sex and age constitution is given very simply in three per cents—for the population under 10 and for males and females 10 years of age and over:

TABLE XXV.—*Age and sex constitution of the population: 1900, 1890, 1880, and 1870.*

CENSUS.	PER CENT OF TOTAL POPULATION.		
	Under 10 years of age.	Males 10 years of age and over.	Females 10 years of age and over.
Continental United States:			
1900	23.7	39.1	37.2
1890	24.3	38.9	36.8
1880	26.7	37.4	35.9
1870	26.8	37.0	36.2

These figures show that the relative number of children in the population of the United States has been decreasing and the relative number of adult males increasing. These changes, both of which favor a higher per cent of breadwinners, are much more marked between 1880 and 1890 than between 1870 and 1880 or between 1890 and 1900. Accordingly, when the calculation for eliminating the effects of differences in age and sex constitution is made by supposing that the relative numbers of men and women and of children at least 10 years of age have not changed since 1870, and using the per cents in Tables XXIV, XXV, and XXVIII, it alters the per cent for 1890 much more sensibly than that for 1880 or 1900.

CENSUS.	PER CENT OF BREADWINNERS IN POPULATION.	
	Before adjustment.	After adjustment.
Continental United States:		
1900	38.3	37.0
1890[1]	37.2	35.6
1880	34.7	34.4
1870	32.4	32.4

[1] Corrected figures; see explanation in Twelfth Census, Report on Occupations, page lxvi.

This shows that the apparent increase in the proportion of breadwinners during the period 1870 to 1900 was largely due to a change in the character of the population—particularly a diminution in the number of children. When correction is made roughly for this change in the population, more than one-fifth of the apparent change in the thirty years disappears. What gain there was came mainly from an increase in the employment of women. For this sex the per cent of breadwinners increased from 13.1 in 1870 to 18.8 in 1900. Probably this increase was due in large part to the growth of the city population. It has been shown on pages 442 to 444 that in cities having at least 50,000 inhabitants, as compared with smaller cities or country districts, relatively more women find remunerative employment. This is significant for the present purpose, because the per cent of the total population living in such cities increased from 14.3 to 18.7 per cent during the decade 1880 to 1890, and to 22.3 per cent in the decade 1890 to 1900.

As compared with 1870, each subsequent census shows a considerable gain in the proportion of breadwinners, and a gain which is not easy to account for on ordinary grounds. In developing the problem the following table for age periods as given in the Ninth and Tenth censuses may be found helpful:

TABLE XXVI.—*Per cent of breadwinners in male and in female population, classified by age periods: 1880 and 1870.*

SEX AND CENSUS.	PER CENT OF BREADWINNERS IN MALE AND IN FEMALE POPULATION.		
	10 to 15 years of age.	16 to 59 years of age.	60 years of age and over.
Continental United States:			
Male—			
1880	21.4	93.4	64.3
1870	19.3	91.0	64.2
Female			
1880	9.0	17.1	5.2
1870	6.9	15.5	5.3

It is difficult to explain the generally higher per cents for 1880, except on the ground that the efforts of the Census Bureau to improve the occupation statistics

resulted in the inclusion of a larger part of the population in the tables. The admitted omission of many negroes in the South in 1870, estimated by the superintendent of the censuses of 1870 and 1880, General F. A. Walker, at between 300,000 and 400,000, does not account for the whole discrepancy, because, as Table XXVII shows, the excess of the per cents for 1880 is rather more marked in the Northern and Western sections of the country than in the South.

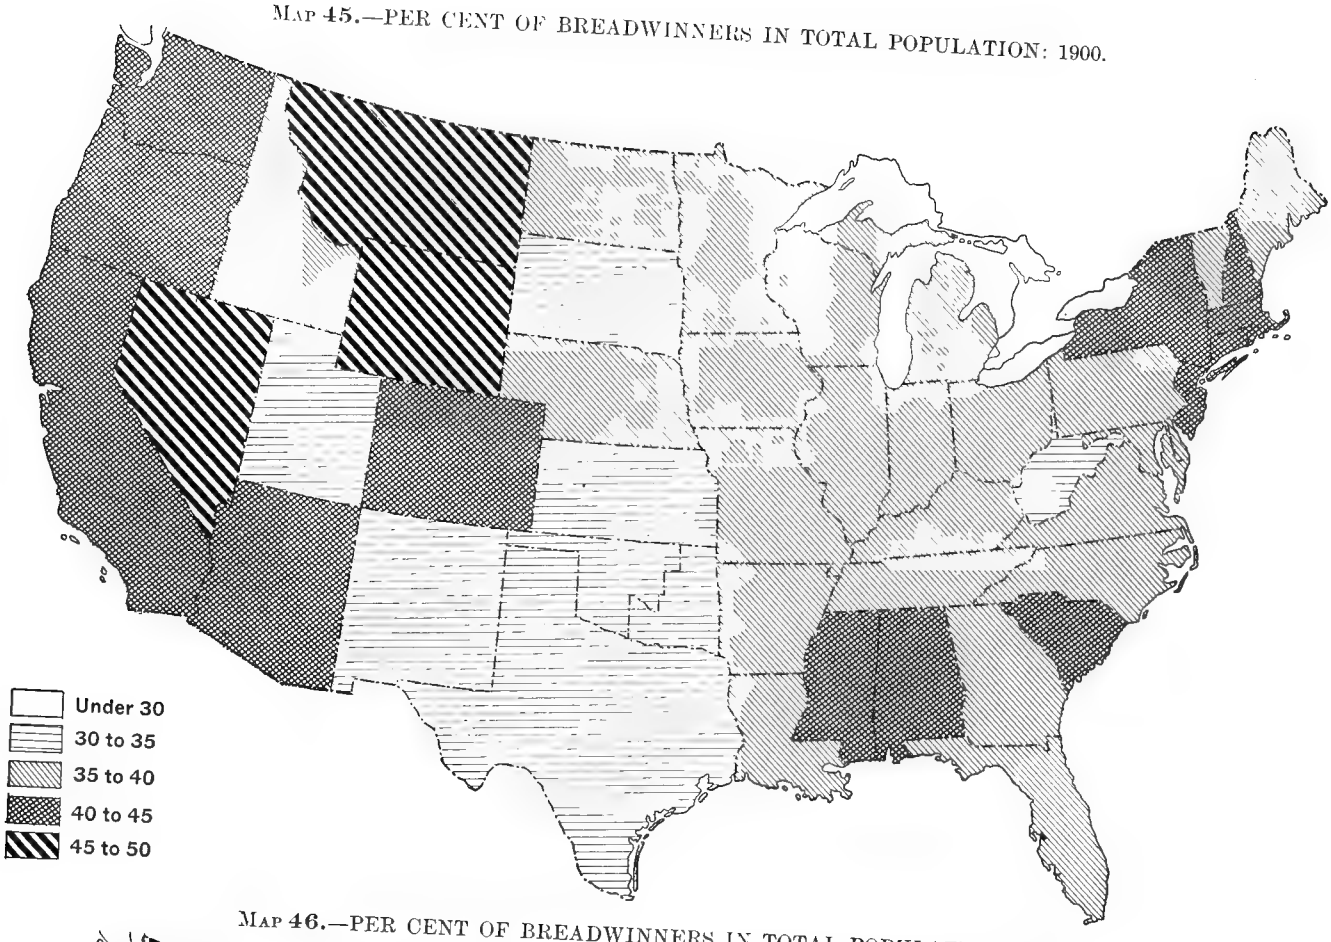

TABLE XXVII.—*Per cent of breadwinners in male and in female population, classified by age periods, for main geographic divisions: 1880 and 1870.*

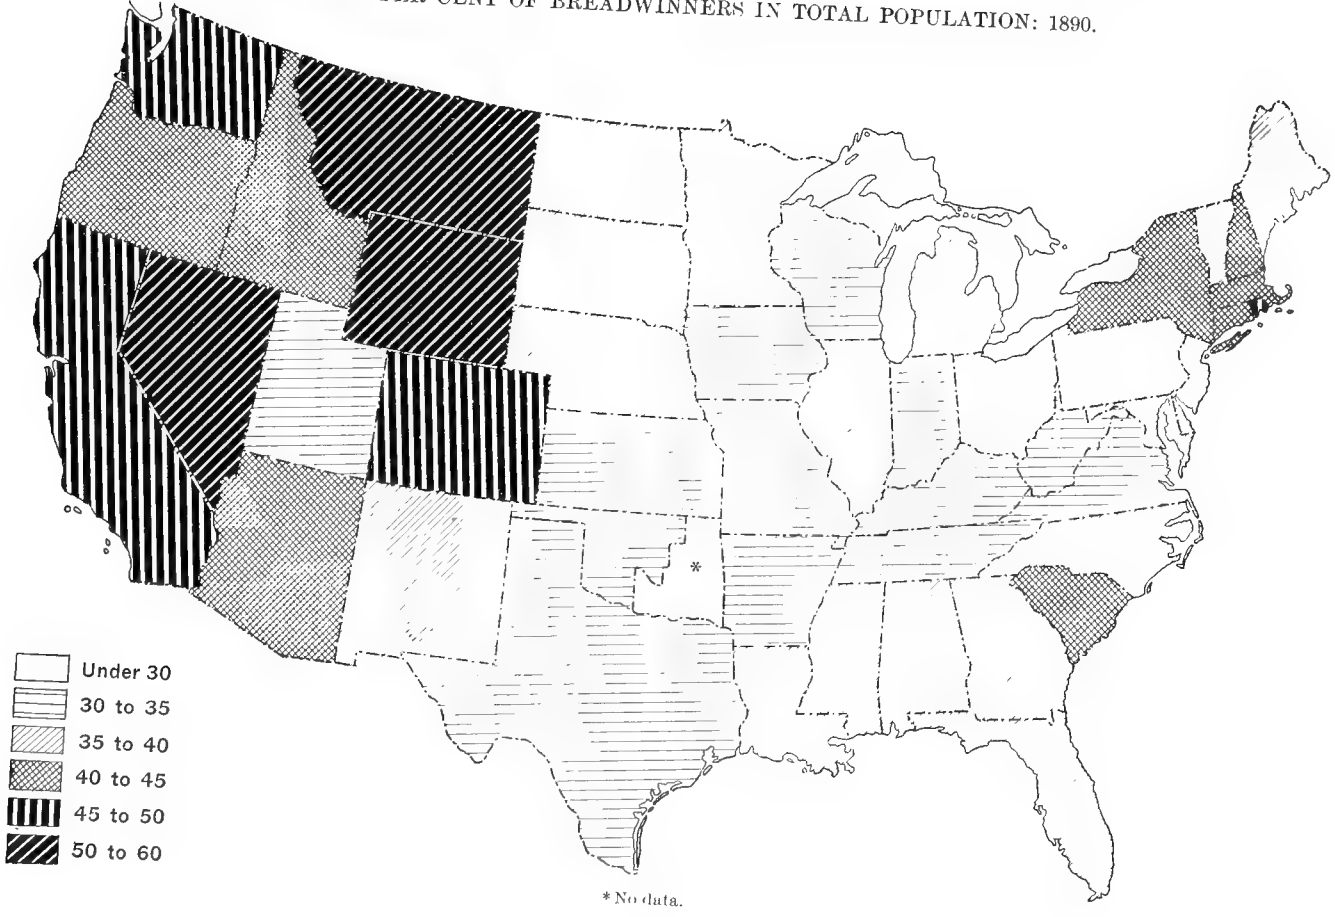
DIVISION AND SEX.	Census.	PER CENT OF BREADWINNERS IN MALE AND IN FEMALE POPULATION.		
		10 to 15 years of age.	16 to 59 years of age.	60 years of age and over.
North Atlantic division:				
Male	1880	15.1	94.6	57.8
	1870	11.5	90.6	57.1
Female	1880	7.5	20.7	3.3
	1870	5.2	17.6	3.5
South Atlantic division:				
Male	1880	40.2	94.9	76.0
	1870	35.9	92.0	75.6
Female	1880	17.9	22.4	10.9
	1870	15.9	20.7	10.6
North Central division:				
Male	1880	16.2	92.1	60.5
	1870	12.2	91.1	61.9
Female	1880	3.1	10.9	2.2
	1870	2.1	9.7	2.3
South Central division:				
Male	1880	41.5	92.7	80.8
	1870	25.8	90.2	80.0
Female	1880	15.7	18.7	11.4
	1870	16.8	18.3	11.8
Western division:				
Male	1880	10.5	93.4	55.4
	1870	7.0	91.9	46.5
Female	1880	2.2	11.0	4.4
	1870	2.4	9.5	4.4



The particularly remarkable fact which these figures profess to establish is that more males 16 to 59 years of age were at work in every part of the country in 1880 than in 1870. No inkling of an explanation of this can be obtained from any of the further analyses of which the figures are susceptible. The increase can not be charged to a growth of the foreign element, for the per cent of foreign born in the total population decreased during the decade. Of course there may actually have taken place a considerable increase in the employment of children and young people between 16 and 20 or 20 and 25 years of age, but there are no data to establish this fact. The explanation already suggested seems more probable. By means of more explicit directions, given to a more intelligent body of enumerators, the Census Bureau obtained a more definite description of occupations, which enabled it to classify a slightly larger proportion of the population under the various captions of the occupation tables. Many persons in the aggregate are put in the "nongainful" class, not because they have no occupation but because it is not clear under which heading of the classification they properly belong. Any improvement in the work of the enumerators will decrease the number of such cases of insufficient specification and so increase the apparent number of breadwinners.

States and territories.—More light upon the increase in the proportion of the aggregate population engaged in gainful occupations can be obtained by examining the changes that have taken place in the several states. The material for studying these changes is furnished by Table XXVIII, on page 458, while Maps 45 to 48 show in graphic form the increase or decrease of the per cents from decade to decade.

[1] Corrected figures; see explanation in Twelfth Census, Report on Occupations, page lxvi.

The changes most readily accounted for are those of the Western division. In four of those states the proportion of the population engaged in gainful occupations decreased from 1870 to 1900, while in four others it increased from 1870 to 1890, and, except in one case, decreased from 1890 to 1900. In both cases the explanation is found primarily in the alteration of the age and sex constitution of the respective populations. It has been customary to think of the Western group of states as a frontier community with relatively few women and children, but one which is gradually approximating the conditions obtaining in the older sections of the country. Of course, in such a community the per cent of breadwinners would be very high, by reason of the preponderance of grown men. As the proportional number of women and children increased and of men decreased with the passage of time, the per cent of breadwinners would in general decline. This, as is shown by the figures in Table XXIX combined with those of Table XXVIII, is a fair statement of the course of development in the four states of Montana, Idaho, Nevada, and Arizona.

TABLE XXIX.—SEX AND AGE CONSTITUTION OF THE POPULATION, FOR STATES AND TERRITORIES OF THE WESTERN DIVISION: 1900, 1890, 1880, AND 1870.

STATE OR TERRITORY.	PER CENT OF TOTAL POPULATION.											
	Under 10 years of age.				Males 10 years of age and over.				Females 10 years of age and over.			
	1900	1890	1880	1870	1900	1890	1880	1870	1900	1890	1880	1870
Western division:												
Montana	21.3	18.4	18.3	11.8	50.8	57.2	62.7	75.3	27.9	24.4	19.0	12.9
Idaho	25.9	25.7	23.3	12.1	44.5	47.7	54.9	75.1	29.6	26.6	21.8	12.8
Wyoming	22.1	21.3	20.7	11.6	51.6	53.8	57.5	72.9	26.3	24.9	21.8	15.5
Colorado	21.2	20.4	18.6	23.9	44.0	49.2	57.1	50.0	34.8	30.4	24.3	26.1

Arizona	23.4	22.7	18.6	14.7	46.4	49.9	60.0	63.7	30.2	27.4	21.4	21.6
Utah	28.9	29.2	32.5	34.9	36.5	38.4	35.1	33.1	34.6	32.4	32.4	32.0
Nevada	17.4	16.5	18.6	13.7	51.6	55.4	58.2	69.3	31.0	28.1	23.2	17.0
Washington	21.2	21.1	25.8	27.6	47.9	51.5	48.1	48.5	30.9	27.4	26.1	23.9
Oregon	20.5	22.1	25.3	28.9	45.9	46.7	46.4	43.8	33.6	31.2	28.3	27.3
California	17.7	18.1	21.2	23.2	46.3	48.8	49.2	50.6	36.0	33.1	29.6	26.2

It coincides less fully with the common belief to find that the course of development in certain other Western states has been precisely the opposite of that typified by the preceding states. In respect to age constitution the population of California, Oregon, New Mexico, and Utah had less of a frontier character in 1870 than in 1900. In California, Utah, and Oregon the relative number of children decreased and of women increased from 1870 to 1900. But in New Mexico there was only a slight change in the relative number of women and of children during the thirty years. The relative number of males 10 years of age and over varied from decade to decade, and in each of the states, other than California, there was in 1900 a higher per cent of males 10 years of age and over in the population than in 1870.

The general increase in the per cent of breadwinners from 1870 to 1890 and the differences in tendency from 1890 to 1900—that is, the increase in the per cent of breadwinners for Oregon and the decrease for New Mexico, Utah, and California—are the resultant of the changes shown in Table XXIX, and the variations in the per cents of male and of female breadwinners, shown in Table XXVIII. The small increase during the last decade in the relative number of breadwinners in Oregon, is probably due for the most part to the increase in the relative number of women and children combined having been more than counteracted by the increase in the proportion of women gainfully employed. In New Mexico, Utah, and California the decrease in the per cent of breadwinners from 1890 to 1900, is probably caused by the increase in the relative number of women and children combined and the decrease in the proportion of breadwinners among males 10 years of age and over. The decline in the per cent of breadwinners among males during the last decade is rather difficult to account for, although the increased prosperity of the section and the more careful enumeration of the Indians in 1900 than in 1890 may have been among the causes. The per cent of breadwinners in the total population was probably affected to a certain extent by other factors, as, for example, by the growth in city population with a corresponding increase in the proportion of women gainfully employed, as well as by the changes in age and sex distribution.

There remain three states in the Western division in which the changes in the per cents have not been regular—Washington, Colorado, and Wyoming. In the first named the proportion of children under 10 years of age has been steadily decreasing, except from 1890 to 1900, but the proportion of males 10 years of age and over and also the proportion of them having gainful occupations were larger in 1890 than in 1870, making the per cent for the whole population smaller at the earlier date, while from 1890 to 1900 the change was in the opposite direction.

The condition in Colorado is different from that in Washington. Between 1870 and 1880 the proportion of children decreased and the proportion of men increased rapidly, so that the per cent of breadwinners rose from 44.1 to 52.1 per cent; but in the next two decades the inrush of immigration was relatively less, the propor-

tion of children increased, while that of males 10 years of age and over decreased, and accordingly the per cent of breadwinners declined.

While the irregular changes in the per cents of breadwinners in Washington and Colorado correspond to irregularities in the development of their populations, the same explanation can not be applied in Wyoming. Its progress from a frontier community in 1870 toward more settled conditions has been rapid and steady, as the figures in Table XXIX show. But instead of a decline in the per cent of breadwinners, such as is found in the other states where the change in the character of the population has been of the same nature, there was a sharp drop from 72.9 per cent in 1870 to 42.7 per cent in 1880, followed by a rise to 50.8 per cent in 1890 and a slight drop to 47.8 per cent in 1900. The low per cent for 1880 is unintelligible, and analysis of the figures by sex and age periods for 1870 and 1880, as shown in Table XXX, only makes the result more baffling.

The chief cause of the low per cent in 1880 is seen from this table to be the relatively very low per cent of men engaged in gainful occupations. We can not explain the fact that only 75.2 per cent of the males between 16 and 59 years of age are reported as having gainful occupations in 1880, when 98.4 per cent of the same class had been at work in 1870 and 95.1 per cent of the males between 15 and 64 were at work in 1890, except upon the hypothesis of defective enumeration.

TABLE XXX.—*Per cent of breadwinners in population, classified by sex and age periods, for Wyoming: 1880 and 1870.*

SEX.	PER CENT OF BREADWINNERS IN MALE AND IN FEMALE POPULATION.					
	10 to 15 years of age.		16 to 59 years of age.		60 years of age and over.	
	1880	1870	1880	1870	1880	1870
Wyoming:						
Male	8.9	0.6	75.2	98.4	44.8	21.2
Female	3.8	1.9	11.6	24.0	4.6	6.7

In the North Central states the development of population and the alterations in the proportions of the people engaged in gainful occupations have been more uniform than in the Western division. The proportion of children decreased, and of males and of females over 10 years of age increased in the division from 1870 to 1900, and such variations from the general tendency as occurred among the states from time to time were due in part to their frontier characteristics. The figures for the whole group of states are as follows:

TABLE XXXI.—SEX AND AGE CONSTITUTION OF THE POPULATION FOR THE NORTH CENTRAL DIVISION: 1900, 1890, 1880, AND 1870.

DIVISION.	PER CENT OF TOTAL POPULATION.											
	Under 10 years of age.				Males 10 years of age and over.				Females 10 years of age and over.			
	1900	1890	1880	1870	1900	1890	1880	1870	1900	1890	1880	1870
North Central	23.0	24.4	26.5	28.4	40.0	39.5	38.5	37.3	37.0	36.1	35.0	34.3

In accordance with this change the per cent of breadwinners increased from 30.0 per cent in 1870 to 36.4 per cent in 1900. Here, again, other factors than alterations in age constitution have evidently been at work. While, for example, the proportion of males 10 years of age and over engaged in gainful occupations increased only from 76.1 to 77.0 per cent between 1880 and 1890, the corresponding per cent for females increased from 8.8 to 12.6. In this the influence of the rapid growth of the cities of the Mississippi valley is chiefly to be seen.

In the southern divisions, both main and minor, the per cent of breadwinners in the total population 10 years of age and over increased steadily from 1870 to 1900. The per cent of breadwinners among females 10 years of age and over also increased steadily from 1870 to 1900 in each of these divisions, with the exception that in the Western South Central division there was a decrease from 1890 to 1900, owing partly to the fact that returns for Indian Territory were first included in the later year. On the other hand, among males there is no such general tendency observable, the per cent of breadwinners among males 10 years of age and over having risen and fallen alternately. The individual states, as a rule, show the same tendencies as those obtaining in the division of which they are parts. This general increase in the proportion of breadwinners in the total population 10 years of age and over thus appears to be largely the result of an increase in the proportion of breadwinners among females 10 years of age and over. Changes in age and sex distribution have also probably affected the results. The omission of large numbers of negroes in 1870 vitiated the per cents for that census. The decline from 1880 to 1890 in the per cent of males 10 years of age and over gainfully employed was due chiefly to the less frequent employment of boys from

10 to 14 and from 15 to 19 years of age, or, in other words, an increase in school attendance. The increase from 1890 to 1900 in the per cent of males 10 years of age and over gainfully employed was probably due to the development of industrial activity in the South.

Finally, in the North Atlantic division all the factors have combined to promote an increase in the proportion of breadwinners. The proportion of children and the excess of women over men have declined. Meanwhile, the urban population has increased rapidly and manufactures have been greatly developed. Consequently from 1870 to 1900, the per cent of breadwinners in the aggregate population has risen in the division, and in each state of the division except New Hampshire, Massachusetts, Rhode Island, and Connecticut, in which the per cents decreased during the decade 1890 to 1900. Taking the figures for the sexes separately we find that the proportion of women engaged in gainful occupations advanced from 1870 to 1900 in all of the states, and the same is true of males except in 5 states, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut, where the per cents were higher in 1890 than in 1900. The latter condition holds for males in Massachusetts with respect to 1870 and 1880 also.

TABLE XXXII.—MALE POPULATION AT LEAST 10 YEARS OF AGE, CLASSIFIED BY MARITAL CONDITION, IN CITIES HAVING AT LEAST 50,000 INHABITANTS AND IN SMALLER CITIES OR COUNTRY DISTRICTS: 1900.

MALE POPULATION AT LEAST 10 YEARS OF AGE: 1900.

STATE OR TERRITORY.	In cities having at least 50,000 inhabitants.					In smaller cities or country districts.

TEACHERS.

SUMMARY OF RESULTS.

In the census of occupations the lines separating the specified occupations are usually vague and ill-defined.

Professional occupations, however, especially what are often styled the learned professions, are clearly distinguished. The returns for these specific occupations may be accepted and subjected to detailed statistical treatment.

Numerically, teachers constitute the most important professional class, exceeding the total number of lawyers, clergymen, and physicians.

In this analysis the proportion of teachers means, unless otherwise stated, the proportion to the total number of persons from 5 to 24 years of age.

The proportion of teachers in the United States is less than in England, but greater than in Germany, France, Italy, Canada, Mexico, or Cuba.

The proportion of teachers in the United States has doubled in the past thirty years; and the increase in recent years has been greater than in England, France, Germany, Italy, or Canada.

The smallest proportion of teachers is in the Southern South Atlantic division and the largest in the Pacific division.

In New England, and in the Western North Central and Pacific divisions the proportion of teachers is higher than in England.

In each state and territory the proportion of teachers has increased during the past decade. The increase has been twice as great in the Western as in any other division. In the Northern divisions the increase has been greater than in the Southern.

For this analysis it is necessary to place the line of demarcation between city and country at 25,000 inhabitants.

In continental United States the proportion of teachers is greater for the city than for the country. This holds also in the Southern and Western divisions. The reverse is true in the Northern divisions.

In continental United States 26.6 per cent of the teachers are males and 73.4 per cent are females. The per cent of male teachers is decreasing and of female teachers increasing. In the other countries for which it was possible to obtain figures covering more than one census the same statement holds true.

There is a higher per cent of male teachers in the Southern than in the Northern and Western divisions.

The largest per cent of male teachers is found in West Virginia, 48.2 per cent, and the smallest in Vermont, 11.8 per cent.

In the cities of every main division about four-fifths, or 80 per cent, of the teachers are women; in the country the per cent of women teachers varies from 59.5 in the South Central division to 77.2 in the North Atlantic division.

In every main division the per cent of male teachers is less in the cities than in the country. In the South the proportion of male teachers in the smaller cities and country districts is twice as great as in the larger cities; in the North Atlantic states there is comparatively little difference between city and country in this respect.

The median age of teachers has increased, indicating older teachers and increased efficiency.

The median age of teachers in the United States is greater than in England, but less than in France and Germany.

The tendency in all of the countries considered is toward teachers of vigorous adult life rather than toward the young or old.

Youthful teachers are relatively most numerous in the North Central and least numerous in the Western division.

Elderly teachers are relatively most numerous in the North Atlantic and least numerous in the North Central division.

The proportion of youthful teachers is greater in the country than in the city.

The ratio of white to negro teachers decreased slightly during the past decade, and in 1900 was about 19 to 1.

In both the white and the negro races the proportion of teachers to the population of the same race 15 years and over increased from 1890 to 1900.

About one-fourth of the white teachers are males, and of the colored teachers from one-third to two-fifths.

On the average, negro teachers are older than white and Indian and Mongolian teachers are younger.

Young male teachers are relatively most numerous among the whites and least numerous among the negroes.

Young female teachers are relatively most numerous among the Indians and Mongolians and least numerous among the whites.

The proportion of teachers among the foreign born population 15 years and over is lower than for any class except the Indians. On the other hand, the corresponding proportion for native white of foreign parentage is the maximum.

For white teachers the proportion of males is highest among the foreign born.

DISCUSSION.

The discussion of specific occupations based upon census figures is rendered difficult by the uncertainties of the classification. The lines between the various specific occupations are often vague: sometimes differing from section to section of the country, and frequently indicated imperfectly by the names given to these occupations in answers returned upon the schedules. For example, it requires much information regarding the specific trades in order to understand the lines between the occupations of blacksmiths, iron and steel workers, and machinists, and to determine whether the very slight increase in the first class and the very rapid increase in the last between 1890 and 1900 is due in part or entirely to a shifting in the lines separating these three occupations.

This difficulty decreases as the amount of learning and degree of skill required for the occupation increase. Thus the lines separating professional occupations, especially what are often styled the learned professions, are more generally recognized and more exactly indicated by the popular name of the occupation. They are also less subject to change between one census and another.

For these reasons it seems safer to subject to detailed analysis the figures for professional occupations than to do so in the cases of other occupations involving many times as many persons and on that account of greater significance, but in which the danger of misunderstanding the figures is also many times multiplied. The occupation of teaching has been chosen to illustrate such an analysis of the census figures because in the United States teachers are more numerous than any other professional class, exceeding the total number of physicians, lawyers, and clergymen.

Comparison with foreign countries.—The number of teachers in the United States has been reported at each of the last four censuses. As the great majority are engaged in teaching persons between 5 and 24 years of age, it seems best to compare the number of teachers with the number of persons at what may be called teachable ages. The last column in the following table shows that proportion:

TABLE I.—*Number and proportion of teachers: 1900, 1890, 1880, and 1870.*

CENSUS.	Number of teachers.	Increase in preceding decade.	Population 5 to 24 years of age.	Number of teachers to 10,000 persons 5 to 24 years of age.
Continental United States:				
1900	446,133	98,789	31,845,462	140
1890	347,344	119,634	27,361,746	127
1880	227,710	100,888	22,294,033	102
1870	126,822	.....	17,389,789	73

The ratio of teachers to persons 5 to 24 years of age nearly doubled during the last thirty years of the nineteenth century, and the increase in the number during the decade 1890 to 1900 was less than in either of the two preceding decades. The increase, however, during the two decades between 1870 and 1890 is open to question, owing to a slight difference in the classification of the occupations,[1] which may have affected the returns, although there is little reason to think so.

In order to get some information regarding the supply of teachers in the United States as compared with that in other countries, the following table, including data from all countries for which the census figures were found, has been prepared:

TABLE II.—*Number and proportion of teachers in certain foreign countries at dates specified.*

COUNTRY.	Census.	Number of teachers.	Population 5 to 24 years of age.	Number of teachers to 10,000 persons 5 to 24 years of age.
England and Wales	1901	230,345	13,196,096	175
	1891	195,021	12,216,022	160
	1881	168,920	10,823,185	156
Germany	1895	232,848	21,333,252	109
	1882	175,679	18,358,980	96
France	1896	143,872	13,339,014	108
	1886	134,777	13,534,217	100
Italy	1901	96,989	12,609,146	77
	1881	79,795	10,800,634	74
Canada	1891	22,183	2,120,960	105
	1881	19,232	1,886,456	102
Cuba	1899	2,708	771,152	35
Mexico	1895	12,583	5,831,234	22

A comparison between the foregoing figures and those for the United States indicates that the latter has a larger proportion of teachers to population of teachable age than Germany, France, Italy, Canada, Mexico, or Cuba, but a smaller proportion than England and Wales. It indicates also that the increase of recent years has been more rapid in the

[1] Special Reports, "Occupations at the Twelfth Census," pages xxxiv and xxxv.

United States than in any other country included in the table for which the data at two or more censuses were found.

Geographic divisions.—The proportion of teachers per 10,000 of teachable age in the main and minor geographic divisions of the United States in 1900 was as follows:

TABLE III.—*Number and proportion of teachers, for main and minor geographic divisions: 1900.*

DIVISION.	1900		
	Number of teachers.	Population 5 to 24 years of age.	Number of teachers to 10,000 persons 5 to 24 years of age.
Continental United States	446,133	31,845,462	140
North Atlantic division	128,341	7,931,382	162
New England	40,219	2,000,387	201
Southern North Atlantic	88,122	5,930,995	149
South Atlantic division	44,883	4,818,428	93
Northern South Atlantic	23,504	1,950,417	121
Southern South Atlantic	21,379	2,868,011	75
North Central division	189,646	10,910,747	174
Eastern North Central	107,784	6,474,656	166
Western North Central	81,862	4,436,091	185
South Central division	55,275	6,639,035	83
Eastern South Central	28,461	3,541,416	80
Western South Central	26,814	3,097,619	87
Western division	27,988	1,545,870	181
Rocky Mountain	6,992	471,176	148
Basin and Plateau	2,624	188,235	139
Pacific	18,372	886,459	207

The preceding table shows that the smallest proportion of teachers to population of teachable age was in the Southern South Atlantic division; the largest proportion in the Pacific states. There are three widely separated regions—the Pacific states, New England, and the Western North Central division—in which the proportion of teachers to population of teachable age is highest, and higher than in England and Wales. The detailed figures for each state and territory at the last four censuses will be found in Table XXVII. In the subjoined list the states with more than two teachers and also those with less than one to each 100 persons between 5 and 24 years of age are arranged in order of rank:

TABLE IV.—*Number of teachers to 10,000 persons 5 to 24 years of age, for specified states: 1900.*

STATE OR TERRITORY.	Number of teachers to 10,000 persons 5 to 24 years of age: 1900.	STATE OR TERRITORY.	Number of teachers to 10,000 persons 5 to 24 years of age: 1900.
Nevada	274	Mississippi	77
Vermont	265	Arkansas	73
Maine	259	Louisiana	70
Iowa	251	New Mexico	68
New Hampshire	232	North Carolina	68
South Dakota	230	South Carolina	67
Oregon	215	Alabama	61
California	212	Alaska	41
Nebraska	206	Porto Rico (1899)	18

The foregoing list of states suggests that the proportion of teachers to population of teachable age is higher in the states having a small urban population than in the states, otherwise similar, where the urban population is large. Note, for example, the large proportion of teachers to population in the three northern New England states, while in no one of the three other New England states are there more than two teachers to each 100 persons of teachable age. Yet the extended table at the end of this section shows that this is by no means uniformly true. Thus the District of Columbia has a higher proportion of teachers than any state in the same division, and Indiana, with a larger proportion of rural population than Ohio or Illinois, has a smaller proportion of teachers than either.

In every state and territory there was an increase, between 1890 and 1900, in the proportion of teachers, the increase in the Western division being more than twice as great as in any other and, as appears from the following figures, that in the Northern states being slightly greater than in the Southern:

TABLE V. *Number and proportion of teachers, for the North and the South: 1900 and 1890.*

GROUP.	NUMBER OF TEACHERS.			POPULATION 5 TO 24 YEARS OF AGE.		NUMBER OF TEACHERS TO 10,000 PERSONS 5 TO 24 YEARS OF AGE.	
	1900	1890	Increase 1890 to 1900	1900	1890	1900	1890
North Atlantic and North Central divisions	317,987	257,376	60,611	18,842,129	16,630,361	169	155
South Atlantic and South Central divisions	100,158	72,861	27,297	11,457,463	9,559,887	87	76

The proportion of teachers to population of teachable age in the North is about twice as great as in the South. It was a little more than that in 1890; a little less in 1900.

City and country.—The number of teachers is reported for each city having at least 25,000 inhabitants as well as for each state and territory. By obtaining the totals for these cities it is possible to measure roughly the supply of teachers relative to population of teachable age in the urban and rural districts, including in the latter all places having less than 25,000 inhabitants. The results of this tabulation are given in detail in Table XXVIII at the end of this section. It shows that in the 160 cities there are on the average 146 teachers to each 10,000 persons between 5 and 24 years of age, while outside these cities there are 138 teachers per 10,000 persons of that age.

These figures show that the supply of teachers relative to population is slightly greater in the cities than outside them, and seem thus to negative the hypothesis already suggested that teachers may be more

numerous in rural communities. Whether the result of the comparison would be materially modified, if teachers who live outside of these cities but work in them could be credited to the cities, is uncertain. But it seems improbable that this current of daily travel is large enough to change the general significance of the ratios.

When the figures for city and country in the different sections are examined the discrepancy between the results is in some measure explained. The figures for the main and minor divisions given in Table VI show that the supply of teachers relative to population in the Southern and Western divisions is greater, and in all except the Pacific states much greater, in cities than outside them; but that, on the contrary, in the North Atlantic and North Central divisions the supply of teachers outside the large cities is greater than within them. The inference may perhaps be drawn that, where an effective educational system is of recent growth, it has developed more rapidly in the cities, but where it has been established for a generation or more it has established a larger ratio of teachers to population in the slowly growing rural districts than in the rapidly growing cities.

TABLE VI.—*Number of teachers to 10,000 persons 5 to 24 years of age in cities having at least 25,000 inhabitants and in smaller cities or country districts, for main and minor geographic divisions: 1900.*

DIVISION.	NUMBER OF TEACHERS TO 10,000 PERSONS 5 TO 24 YEARS OF AGE: 1900.		
	In total population.	In cities having at least 25,000 inhabitants.	In smaller cities or country districts
Continental United States	140	146	138
North Atlantic division	162	137	184
New England	201	166	226
Southern North Atlantic	149	129	168
South Atlantic division	93	155	86
Northern South Atlantic	121	151	112
Southern South Atlantic	75	156	71
North Central division	174	150	181
Eastern North Central	166	145	174
Western North Central	185	163	188
South Central division	83	133	79
Eastern South Central	80	137	76
Western South Central	87	130	83
Western division	181	213	171
Rocky Mountain	148	235	134
Basin and Plateau	139	199	131
Pacific	207	209	207

Table XXIX shows for each city of at least 25,000 inhabitants the proportion of teachers to 10,000 persons of teachable age. In some cities a high proportion is probably due to the fact that a number of teachers reside there but teach elsewhere. For example, the rank of Newton as second among the 160 cities may be due largely to its attractions as a place of residence for teachers whose working hours are passed in Boston. But another important influence is the small proportion of children in the total population of Newton. Among the 20 Massachusetts cities it has the largest proportion of teachers to population of teachable age and the smallest proportion of children under 5 to women of child-bearing age. So there may be in some cases a similar indirect connection between many children and few teachers. Thus, Johnstown is third among the cities of the country in the proportion of children and has fewer teachers than any city except the abnormal Atlantic City.

The proportion of teachers is not at a minimum in southern cities; on the contrary there are scattered cities in the North and West—Johnstown, Kansas City, Kans., South Omaha, Elizabeth, Manchester—in which the proportion of teachers is less than in any southern city except Memphis.

Sex.—Table VII shows that in the occupation of teachers the proportion of males has been steadily decreasing and that of females increasing. In 1870 one-third of the teachers of the country were male; in 1900 hardly more than one-fourth were male.

TABLE VII.—*Distribution of teachers by sex: 1900, 1890, 1880, and 1870.*

CENSUS.	TEACHERS.				
	Number.			Per cent.	
	Total.	Male.	Female.	Male.	Female.
Continental United States:					
1900	446,133	118,519	327,614	26.6	73.4
1890	347,344	101,278	246,066	29.2	70.8
1880	227,710	73,335	154,375	32.2	67.8
1870	126,822	42,775	84,047	33.7	66.3

Table VIII presents a comparison between the sex proportion of teachers in the United States and that in other countries. In Germany about two-thirds of the teachers were male, in Mexico and Cuba about one half, in France about two-fifths, in Italy and Canada about one-third, and in Great Britain and the United States about one-fourth. In each of the countries for which the figures cover more than one census the proportion of male teachers has decreased in recent years.

TABLE VIII.—*Distribution of teachers by sex, for certain countries at dates specified.*

COUNTRY.	Date of census.	TEACHERS.				
		Number.			Per cent.	
		Total.	Male.	Female.	Male.	Female.
Great Britain and Ireland	1901	275,591	73,875	201,716	26.8	73.2
	1891	236,194	65,817	170,377	27.9	72.1
	1881	207,553	61,539	146,014	29.6	70.4
Germany	1895	232,848	159,581	73,267	68.5	31.5
	1882	175,679	127,614	48,065	72.6	27.4
France	1896	143,872	60,993	82,879	42.4	57.6
	1886	134,777	73,272	61,505	54.4	45.6
Italy	1901	96,989	34,346	62,643	35.4	64.6
	1881	79,795	32,908	46,887	41.2	58.8
Canada	1891	22,183	7,352	14,831	33.1	66.9
	1881	19,232	7,108	12,124	37.0	63.0
Cuba	1899	2,708	1,206	1,502	44.5	55.5
Mexico	1895	12,583	6,120	6,463	48.6	51.4

As recent comment on the educational system of the United States on the part of English experts has implied that the proportion of female teachers in the United States was much larger than in Great Britain, it is worthy of note that no warrant for such an as-

sumption seems to be furnished by the census figures of the two countries.

But when attention is confined to the figures for the 632 cities having at least 8,000 inhabitants in 1900, for which the totals are given by the Commissioner of Education,[1] it appears that of the 82,650 teachers in the cities, excluding all supervising officers, only 6,302, or 7.6 per cent, were male, and 76,348, or 92.4 per cent, were female.

One important cause of this large proportion and rapid increase of female teachers is doubtless the fact that the opportunities for the higher education of women have increased rapidly of recent years, and in Great Britain and the United States are or have been greater than in other countries. With reference to the difference between Canada and the United States, it should be noticed that Canada has a smaller proportion of urban population than the United States, and that, as will appear from a subsequent paragraph, the proportion of male teachers, at least in the United States, is greater in the rural districts than it is in cities.

In the following table the proportion of each sex among the teachers reported by the census in 1900 is given for each main and minor division. The numbers and per cents for each state and territory, both in 1900 and in 1890, will be found in Table XXX.

TABLE IX.—*Distribution of teachers by sex, for main and minor geographic divisions: 1900.*

DIVISION.	TEACHERS: 1900.				
	Number.			Per cent.	
	Total.	Male.	Female.	Male.	Female.

Western South Central .	26,814	10,691	16,123	39.9	60.1
Western division.....	27,988	7,173	20,815	25.6	74.4
Rocky Mountain.....	6,992	1,723	5,269	24.6	75.4
Basin and Plateau.....	2,624	881	1,743	33.6	66.4
Pacific.....	18,372	4,569	13,803	24.9	75.1

The table shows that the male teachers in the North Atlantic division were about one-fifth and in the South Atlantic division nearly two-fifths of the total number. It shows also that New England has a much smaller proportion of male teachers than any other minor geographic division and that the Western South Central has the largest. There is no state or territory in which the male teachers outnumber the female, the nearest approach to that being in West Virginia (48.2 per cent), Arkansas (47.5 per cent), and Texas (42.2 per cent), in each of which the number of male teachers in 1890 exceeded that of female. The smallest proportion of male teachers (11.8 per cent) is found in Vermont.

The very slight increase in the proportion of male teachers in New England between 1890 and 1900 and the almost identical proportions in the Southern North Atlantic division at the two dates suggest that a stable adjustment may have been reached in the two divisions with the smallest proportion of males.

To determine the relative proportion of the sexes among teachers in cities and in country districts, the following table has been prepared:

TABLE X. *Distribution of teachers by sex, in cities having at least 25,000 inhabitants and in smaller cities or country districts: 1900.*

CITY OR COUNTRY.	TEACHERS: 1900.				
	Number.			Per cent.	
	Total.	Male.	Female.	Male.	Female.
Continental United States..	446,133	118,519	327,614	26.6	73.4
Cities having at least 25,000 inhabitants.....	110,733	19,869	90,864	17.9	82.1

Smaller cities or country districts.....	20,364	5,744	14,620	28.2	71.8

The table shows that in the 160 large cities of the United States nearly five-sixths of the reported teachers are females, and outside of these cities only seven-tenths are females. This difference between city and country in the sex distribution of teachers is found also in each main division. It is least in the North Atlantic division, intermediate in amount in the North Central and Western divisions, and greatest in the two Southern divisions, where the per cent of males is

[1] Report for 1899–1900, page 1787.

about twice as great outside the large cities as within them.

The per cent of males among teachers in large cities is about the same in the several divisions, ranging only from 17.4 in the North Atlantic states to 20.1 in the South Central. But the per cent of males among teachers outside of such cities has a much greater range, namely, from 22.8 in the North Atlantic to 40.5 in the South Central.

Age.—In 1870 and 1880 the teachers in the United States were classified into only three age periods, 10 to 15, 16 to 59, and 60 years and over. Nearly all the teachers fell into the second of these three periods and for present purposes, therefore, this classification has little significance. In 1890 and 1900 teachers in the United States were classified into the seven age periods shown in the following table:

TABLE XI.—*Distribution of teachers by age periods: 1900 and 1890.*

AGE PERIOD.	NUMBER OF TEACHERS.		PER CENT DISTRIBUTION OF TEACHERS.	
	1900[1]	1890	1900[1]	1890
Continental United States:				
All ages	446,797	347,344	100.0	100.0
10 to 14 years	157	257	(2)	0.1
15 to 24 years	188,577	170,552	42.2	49.1
25 to 34 years	159,325	107,931	35.7	31.1
35 to 44 years	58,466	38,131	13.1	11.0
45 to 54 years	24,611	18,679	5.5	5.4
55 to 64 years	10,543	7,197	2.4	2.1
65 years and over	3,807	2,884	0.8	0.8
Age unknown	1,311	1,413	0.3	0.4

[1] Figures include teachers in Alaska, Hawaii, and the military and naval service stationed abroad.
[2] Less than one-tenth of 1 per cent.

The detailed figures from which the preceding summary has been derived will be found in Tables XXXI and XXXII. The summary shows that in 1890 nearly one-half of the teachers in the United States were less than 25 years of age, but that in 1900 this proportion had decreased to little more than two-fifths. The proportion between 25 and 34 years of age had increased during the decade but with somewhat less rapidity. Consequently, the proportion under 35 years of age, which in 1890 was no less than four-fifths (80.3 per cent), was in 1900 only 77.9 per cent and the proportion of teachers at least 35 years of age, which in 1890 was 19.7, had increased by 1900 to 22.1. These figures indicate that this occupation is being entered at a somewhat later age, and perhaps, also, that the persons entering it remain in it on the average for a somewhat longer time. As training and experience are largely dependent upon age, this decrease in the proportion of young school teachers is an indication of increased efficiency.

With the foregoing figures, those for England and Wales in 1891 and 1901 and for France in 1896 may be compared. The age classification has been brought into as close agreement as possible with that of the United States.

TABLE XII.—*Per cent distribution of teachers by age periods, for the United States, England and Wales, and France at dates specified.*

AGE PERIOD.	UNITED STATES.		ENGLAND AND WALES.		FRANCE.
	1900[1]	1890	1901	1891	1896

[1] Figures include teachers in Alaska, Hawaii, and the military and naval service stationed abroad.
[2] Less than one-tenth of 1 per cent.
[3] Includes all under 25 years of age.

The per cents show that the proportion of youthful teachers in England and Wales was less in 1891 than in the United States in 1890, but greater in 1901 than in the United States in 1900. In both countries there was a decrease in the proportion of youthful teachers during the decade covered, but that decrease was much more rapid in the United States than in England and Wales. In both countries the proportion of youthful teachers is much greater and the proportion of elderly teachers less than in France. The following figures for Germany may be compared with the foregoing, although the differences in the age classification are an obstacle to the comparison:

TABLE XIII.—*Per cent distribution of teachers by age periods, for the German Empire: 1895 and 1882.*

AGE PERIOD.	1895	1882
Germany:		
All ages	100.0	100.0
Under 20 years	3.1	3.8
20 to 29 years	29.8	33.6
30 to 39 years	30.4	24.3
40 to 49 years	18.4	17.6
50 to 59 years	12.2	12.5
60 to 69 years	5.1	6.7
70 years and over	1.0	1.5

Comparison of the figures for Germany with the preceding shows that here, too, has been a decrease, during the thirteen years covered, in the proportion of youthful teachers. A closer examination shows that both in England and in Germany there has been a concentration on the years of vigorous adult life, the proportion of elderly as well as of youthful teachers having declined in both countries. In England and Wales the per cent of teachers under 35 years of age sank from 75.9 in 1891 to 72.7 in 1901, the per cent of teachers 65 years and over sank from 1.2 to 0.8, the per cent between 45 and 64 remained unchanged, and that between 35 and 44 increased from 12.4 to 16.0. In Germany the per cent of teachers between 30 and

49 increased from 41.9 in 1882 to 48.8 in 1895, while the per cent under 30 years of age decreased from 37.4 in 1882 to 32.9 in 1895, and the per cent at least 50 years of age decreased from 20.7 in 1882 to 18.3 in 1895. In both countries teachers in the best years of adult life have been gaining relatively to the young and the old. The greater age of teachers in Germany appears perhaps most clearly from the statement that relatively to the total number there are almost as many teachers in Germany 50 years old or more as there are in the United States 35 years old or more (18.3 per cent compared with 21.8 per cent).

The differences in the age of teachers in the three countries are best indicated by a computation of the median age at each of the two censuses—that is, the age which divides the teachers into two equal groups. The results are as follows:

TABLE XIV. *Median age of teachers for the United States, England and Wales, Germany, and France at dates specified.*

COUNTRY AND CENSUS.	Median age of teachers.
United States:	
1900[1]	27.2
1890	25.3
England and Wales:	
1901	26.5
1891	25.8
Germany:	
1895	35.6
1882	35.2
France:	
1896	38.6

[1] Figures include teachers in Alaska, Hawaii, and the military and naval service stationed abroad.

These figures show that the median age of teachers in Germany in 1895 was more than nine years greater and in France in 1896 more than twelve years greater than in the United States or England at the same time. They also show that the increase of the median age in the United States has been 1.9 years in ten; in England and Wales 0.7 in ten; and in Germany 0.4 in thirteen or about 0.3 in ten. The increase of age in the United States has thus been nearly three times as rapid as in England and Wales and six times as rapid as in Germany.

The census of Italy, 1901, gives the classification of teachers into the three age periods, 9 to 14, 15 to 64, and 65 and over. The last age period is comparable with the last of the seven age periods of the American census. The results show that in Italy 3 per cent of the reported teachers are at least 65 years of age and in the United States 0.8 per cent were of corresponding age. The proportion of elderly teachers in Italy is thus much greater than in the United States and probably as great as in Germany.

Age by main geographic divisions.—The occupation tabulations of the Twelfth Census give the teachers in each state and territory, classified by age into six groups as in the following table. But in these tables the figures for male teachers in Wyoming and Nevada were omitted, and consequently in the compilation all figures for those states have been excluded. The error thereby introduced is, however, so small as not to invalidate any conclusions that may be drawn from the figures.

TABLE XV.—*Per cent distribution of teachers by age periods in main geographic divisions: 1900.*

DIVISION.	PER CENT DISTRIBUTION OF TEACHERS: 1900.						
	All ages.	Under 16 years.	16 to 24 years.	25 to 44 years.	45 to 64 years.	65 years and over.	Age unknown.
Continental United States..	100.0	0.1	42.1	48.7	7.9	0.9	0.3
North Atlantic	100.0	0.1	36.6	51.7	10.3	1.1	0.2
South Atlantic	100.0	0.1	41.2	47.7	9.3	1.4	0.3
North Central	100.0	0.1	47.1	46.4	5.7	0.5	0.2
South Central	100.0	0.1	42.7	47.7	8.0	1.1	0.4
Western	100.0	0.1	34.4	54.8	9.1	0.9	0.7

The figures show that youthful teachers are most numerous relatively to the whole number in the North Central states and least numerous in the Western states. Elderly teachers, 45 years old or more, are most numerous in the North Atlantic states, where they constitute over one-ninth (11.4 per cent) of the entire number. They are least numerous in the North Central where they constitute about one-sixth (6.2 per cent).

Age in city and country.—Of the 78 cities in the United States each having at least 50,000 inhabitants in 1900, the age distribution of teachers is given for 64. By combining the figures for these cities it becomes possible to get an approximate age classification of teachers in the cities and in the country. The results are as follows:

TABLE XVI.—*Per cent distribution of teachers by age periods in 64 cities having at least 50,000 inhabitants and in smaller cities or country districts: 1900.*

	PER CENT DISTRIBUTION OF TEACHERS: 1900.						
	All ages.	Under 16 years.	16 to 24 years.	25 to 44 years.	45 to 64 years.	65 years and over.	Age unknown.
Continental United States..	100.0	0.1	42.1	48.7	7.9	0.9	0.3
64 cities having at least 50,000 inhabitants	100.0	0.1	27.6	57.0	13.5	1.5	0.3
Smaller cities or country districts	100.0	0.1	45.7	46.7	6.5	0.7	0.3

The proportion of youthful teachers in large cities is much below that in the rest of the country. This appears most clearly from a computation of median ages. The median age of city teachers is 28.9 years, that of country teachers 25.9.

Race.—The teachers of the United States were classified in 1890 into the three racial divisions of white, negro, and Indian and Mongolian, the last two

being very few in numbers and for that reason not distinguished in the returns. In 1900, however, this further distinction was made. It should be noticed, also, that the figures for 1890 excluded and those for 1900 included returns from Indian Territory and the Indian reservations. The results of this classification, by race, appear in the following figures:

TABLE XVII.—*Distribution of teachers by race: 1900 and 1890.*

RACE.	TEACHERS.			
	Number.		Per cent distribution.	
	1900	1890	1900	1890
Continental United States	446,133	347,344	100.0	100.0
White	424,422	332,187	95.1	95.6
Negro	21,267	15,100	4.8	4.4
Indian and Mongolian	444	57	0.1	(1)
Indian	384	(2)	0.1	(2)
Mongolian	60	(2)	(1)	(2)

[1] Less than one-tenth of 1 per cent.
[2] Not returned separately.

The figures show that about 19 teachers out of 20 in the United States are white and 1 in 20 negro. They show, also, that the proportion of white slightly declined and that of negro slightly increased during the decade between 1890 and 1900.

A more instructive comparison may be made by finding the ratio between the number of teachers of each race and the total population at least 15 years of age in that race. The results of this compilation are shown in the following table:

TABLE XVIII.—*Proportion of teachers in population 15 years and over, classified by race: 1900 and 1890.*

RACE.	NUMBER OF TEACHERS.		POPULATION 15 YEARS AND OVER.		NUMBER OF TEACHERS TO 10,000 PERSONS 15 YEARS AND OVER.	
	1900	1890	1900	1890	1900	1890
Continental United States	446,133	347,344	49,869,590	40,380,050	89	86
White	424,422	332,187	44,291,680	35,939,102	96	92
Negro	21,267	15,100	5,323,591	4,295,271	40	35
Indian and Mongolian	444	57	254,319	145,677	17	4
Indian	384	(1)	143,573	(1)	27	(1)
Mongolian	60	(1)	110,746	(1)	5	(1)

[1] Not returned separately.

For reasons already stated the proportion of Indians and Mongolians in 1890 is without significance. The table shows that the proportion of negro teachers to the negro adult population is much greater than that of Indian teachers to adult Indians, and the proportion of white teachers to white adults is more than double the proportion among the negroes. It shows that certainly in the two main races, and probably also in the third, the proportion of teachers to adult population increased in the decade 1890 to 1900.

Race and sex.—The following table shows the sex proportion of the white, negro, and Indian teachers in 1900:

TABLE XIX.—*Distribution by sex of teachers, classified by race: 1900.*

RACE.	TEACHERS: 1900.				
	Number.			Per cent.	
	Total.	Male.	Female.	Male.	Female.
Continental United States	446,133	118,519	327,614	26.6	73.4
White	424,422	110,570	313,852	26.1	73.9
Negro	21,267	7,743	13,524	36.4	63.6
Indian	384	148	236	38.5	61.5

The table shows that about one-fourth of the white teachers and between one-third and two-fifths of the negro and Indian teachers are male. It has already appeared, however, that the proportion of male teachers is larger in the South than in the North. The difference, therefore, between the white and negro races in this respect may be due to the fact that the majority of the negroes live in the South and the majority of whites in the North. To test this conjecture, the figures have been further analyzed by distinguishing the races in the North Atlantic and North Central states on the one hand and the South Atlantic and South Central states on the other. The results are shown in the following figures:

TABLE XX.—*Distribution by sex of teachers, classified by race, for the North and the South: 1900.*

	TEACHERS: 1900.				
	Number.			Per cent.	
	Total.	Male.	Female.	Male.	Female.
North Atlantic and North Central divisions:					
White	315,589	75,505	240,084	23.9	76.1
Negro	2,299	791	1,508	34.4	65.6
South Atlantic and South Central divisions:					
White	80,970	27,981	52,989	34.6	65.4
Negro	18,948	6,947	12,001	36.7	63.3

The figures show that in the Southern states there is a slight difference between the races in the proportion of male and female teachers, but hardly large enough to be significant. The difference shown by Table XIX, therefore, is mainly geographic and not racial.

Race and age.—The teachers in the United States in 1900 were classified into the three race groups of white, negro, and other non-Caucasians (that is, Indian and Mongolian), and seven age groups. The extended table will be found at the end of this section. The results of present importance are as follows:

TABLE XXI.—*Per cent distribution by age periods of teachers, classified by race: 1900.*

AGE PERIOD.	PER CENT DISTRIBUTION OF TEACHERS: 1900.			
	Total.	White.	Negro.	Indian and Mongolian.
Area of enumeration: All ages	100.0	100.0	100.0	100.0
10 to 14 years	(1)	(1)	(1)	0.2
15 to 24 years	42.2	42.3	40.6	45.7
25 to 34 years	35.7	35.5	38.3	29.5
35 to 44 years	13.1	13.0	15.5	13.7
45 to 54 years	5.5	5.6	4.2	6.9
55 to 64 years	2.4	2.4	0.9	2.4
65 years and over	0.8	0.9	0.2	1.2
Age unknown	0.3	0.3	0.3	0.4

[1] Less than one-tenth of 1 per cent.

The table shows that the proportion of negro teachers less than 25 years of age is below and that of Indian and Mongolian teachers (mainly Indian) above the proportion for whites. Computing the median age for teachers of each race the results are as follows:

TABLE XXII.—*Median age of teachers, classified by race: 1900.*

RACE.	Median age of teachers: 1900.
Area of enumeration:	
White	27.2
Negro	27.5
Indian and Mongolian	26.4

Negro teachers are, then, a little older and Indian and Mongolian teachers a little younger than white teachers.

Race, sex, and age.—The slightly greater age of negro teachers shown by the figures in the preceding table may be due entirely to the larger proportion of male teachers in that race and the great average age of male teachers. To test this possibility the sex classification must be introduced, as it is in Table XXXI. The general results are shown by the following summary:

TABLE XXIII.—*Per cent distribution by age periods of teachers, classified by race and sex: 1900.*

AGE PERIOD.	PER CENT DISTRIBUTION OF TEACHERS: 1900.					
	Male.			Female.		
	White.	Negro.	Indian and Mongolian.	White.	Negro.	Indian and Mongolian.
Area of enumeration: All ages	100.0	100.0	100.0	100.0	100.0	100.0
10 to 14 years	.....	.....	0.4	.....	0.1	.....
15 to 24 years	30.5	20.2	24.6	46.2	52.3	65.5
25 to 34 years	38.2	42.4	35.8	34.7	35.9	23.5
35 to 44 years	16.8	26.6	20.0	11.8	9.1	7.8
45 to 54 years	8.2	8.5	11.3	4.7	1.7	2.8
55 to 64 years	4.1	1.5	5.0	1.8	0.5	.....
65 years and over	1.9	0.3	2.1	0.5	0.2	0.4
Age unknown	0.3	0.5	0.8	0.3	0.2	.....

The preceding figures show that young male teachers are relatively most numerous among whites and least numerous among negroes. Young female teachers, on the contrary, are most numerous among the Indians and least numerous among whites. Of the Indian female teachers two-thirds, and of the negro female teachers more than one-half, are less than 25 years of age. The median age of male teachers in 1900 was for whites, 30.1 years; for negroes, 32 years; and for Indians and Mongolians, 32 years. The median age for female teachers in 1900 was for whites, about 26 years; for negroes, a little less than 25 years; and for Indians and Mongolians, about 23 years.

Nativity and nativity of parents.—The white teachers may be further classified, according to their birthplace and parentage, into those born abroad, those born in the United States of native parents, and those born in the United States with one or both parents born abroad. In the following table the number of teachers belonging to each of these classes is brought

into comparison with the number of adults of the same class:

TABLE XXIV.—*Proportion of teachers in the white population 15 years and over, classified by nativity: 1900 and 1890.*

NATIVITY.	NUMBER OF TEACHERS.		POPULATION 15 YEARS AND OVER.		NUMBER OF TEACHERS TO 10,000 PERSONS 15 YEARS AND OVER.	
	1900	1890	1900	1890	1900	1890
Continental United States:						
White	424,422	332,187	44,291,680	35,939,102	96	92
Native white—native parents	292,745	240,024	25,649,871	21,410,860	114	112
Native white—foreign parents	104,543	69,525	8,939,118	6,137,734	117	113
Foreign born white	27,134	22,638	9,702,691	8,390,508	28	27

A comparison of this table with the preceding one shows that the immigrant population contributes fewer teachers relatively to its numbers than the negroes and about the same number as the Indians. It shows that the children of immigrants, however, have entered this occupation in such large numbers that the proportion of teachers among adults of this class in 1890 was slightly greater than the proportion among the native whites of native parents, and also that it increased a little more rapidly during the decade, 1890 to 1900. This is probably due, in some measure, to the fact that the immigrant population and their children lived mainly in the Northern and Western states, where the proportion of teachers is much higher than it is in the South.

Sex and nativity.—The white teachers of these three birthplace classes may be further classified by sex The resulting figures are given below:

TABLE XXV.—*Distribution by sex of white teachers, classified by nativity: 1900.*

NATIVITY.	TEACHERS: 1900.				
	Number			Per cent.	
	Total.	Male.	Female.	Male.	Female.
Continental United States:					
White	424,422	110,570	313,852	26.1	73.9
Native white—native parents	292,745	84,682	208,063	28.9	71.1
Native white—foreign parents	104,543	15,998	88,545	15.3	84.7
Foreign born white	27,134	9,890	17,244	36.4	63.6

The figures show that the proportion of males is largest among the foreign born white teachers and smallest among the native white born of foreign parents. A fairer basis of comparison is probably one between the number of teachers and the adult population of each class, as in the following figures:

TABLE XXVI.—*Proportion of teachers in the white population 15 years and over, classified by nativity and sex: 1900 and 1890.*

SEX AND NATIVITY.	NUMBER OF TEACHERS.		POPULATION 15 YEARS AND OVER.		NUMBER OF TEACHERS TO 10,000 PERSONS 15 YEARS AND OVER.	
	1900	1890	1900	1890	1900	1890
Continental United States:						
White	424,422	332,187	44,291,680	35,939,102	96	92
Males	110,570	93,995	22,808,628	18,534,187	48	51
Females	313,852	238,192	21,483,052	17,404,915	146	137
Native white native parents	292,745	240,024	25,649,871	21,410,860	114	112
Males	84,682	73,677	13,088,058	10,880,185	65	68
Females	208,063	166,347	12,561,813	10,530,675	166	158
Native white foreign parents	104,543	69,525	8,939,118	6,137,734	117	113
Males	15,998	11,484	4,463,311	3,073,413	36	37
Females	88,545	58,041	4,475,907	3,064,321	198	189
Foreign born white	27,134	22,638	9,702,691	8,390,508	28	27
Males	9,890	8,834	5,257,359	4,580,589	19	19
Females	17,244	13,804	4,445,332	3,809,919	39	36

The preceding table shows that in each one of the four classes the proportion of teachers to the total adult population increased in the decade between 1890 and 1900, but that in each class, except the foreign born whites, this was the result of an increase in the proportion of female teachers partially counteracted by a decrease in the proportion of male teachers. It shows, also, that among males the largest proportion of teachers to population is found among the native white of native parents; but that among females the largest proportion of teachers is found among the children of immigrants. The large proportion of teachers among the daughters of immigrants is probably due in part to their residence in the Northern states, and especially in Northern cities, where the school system is highly developed. It may be due also, in part, to the fact that the average income of immigrants' children is likely to be somewhat less than the average income of children of native Americans, and for this reason daughters of immigrants are more likely to support themselves partly or entirely by their earnings.

TABLE XXVII.—NUMBER AND PROPORTION OF TEACHERS: 1900, 1890, 1880, AND 1870.

STATE OR TERRITORY.	POPULATION 5 TO 24 YEARS OF AGE.				NUMBER OF TEACHERS.				NUMBER OF TEACHERS TO 10,000 PERSONS 5 TO 24 YEARS OF AGE.

SUPPLEMENT.

A Discussion of the Vital Statistics of the Twelfth Census, by Dr. John Shaw Billings.
The Negro Farmer, by W. E. Burghardt Du Bois, Ph. D.
Methods of Estimating Population.

A DISCUSSION OF THE VITAL STATISTICS OF THE TWELFTH CENSUS.

By Dr. John Shaw Billings.

In any large reference library in this country many inquiries concerning vital statistics are made which can be answered only, if at all, by reference to reports on this subject published by individual states and cities or by the National Government. The most general inquiry propounded is "what official reports relating to births, marriages, and deaths have been published in this country, and which of these reports have you available for reference?" The answer to the last part of this question, as given by the catalogue of the library under the heading "Statistics (Vital) United States," and under the names of the states and cities, is a fairly good answer to the whole general question, since there are very few official documents of any value relating to this subject which are not contained in such a library.

In the great majority of cases this answer is of very little use to the reader, who has no idea which of the reports specified contains the information of which he is in search, and who may waste much time and labor in seeking for what does not exist. For example, one person wants data as to the effects of the emancipation of slaves on the birth and death rates of the negro, as shown by these rates in Virginia for the five years preceding and the five years following the Civil War. There are no official data of this kind of any value. Another person wishes to compare the death rates of coal miners in the United States, in Belgium, and in Great Britain for the last ten years, but no such data are available for the United States.

If the purpose in consulting these reports be to obtain comparative data showing the result of varying conditions upon the general mortality, or to show the relative death rates at different ages, from different causes or of different classes of population in the same or different places during a series of consecutive years, the information must be sought from the local reports on this subject issued by the states or cities for which comparisons are wanted. Here the student or analyst finds great difficulty in securing any comprehensive information, owing to lack of tables covering the details sought. Very few of the cities make any extensive compilation of the material at their command, and in such compilations which are most complete, as well as in the state reports, there are differences in the forms of tables and in the methods of classifying the data which prevent carrying comparisons very far, even if they do not entirely preclude them.

On the other hand, the general statistics heretofore published by the Bureau of the Census, while giving uniform results for the different states and cities as far as the data permit, cover only the "census" years, and the fact that the primary purpose of such statistics is to furnish comparative data for a large number of different areas in a limited space makes it necessary to treat the subject in a broad sense and to give only the most important details.

The factors, in addition to locality, which influence the mortality, such as age, sex, color, nativity and parent nativity, conjugal condition, occupation, and season, are so numerous that to give tables showing all of them in their complex relations to causes of death in each area, in a general report of this kind, is entirely impracticable. For example, the principal table, giving deaths from each cause by age and sex, requires 8 pages for each area; but if these data were shown in relation to color, by conjugal condition and nativity, it would require over 1,000 pages for each area. The student, therefore, should not expect to find every combination of data that he may wish for special purposes, but some of the most essential details of general interest will be found presented very fully.

There is no subject of importance connected with national growth and development upon which the general public is so ignorant and indifferent as that of the vital statistics of the people. It is due to this ignorance and indifference that no adequate legal provision is made in many of the states and cities for the proper registration of births, marriages, and deaths, which is essential to correct vital statistics.

In view of the importance of the subject, it seems useful to supplement the reports on vital statistics of the Twelfth Census by a few suggestions as to some of the uses which may be made of them, prepared, not for the use of statisticians and experts, but for the information of those who have little knowledge of the subject and of its relations to the daily interests of life.

The interest and value of vital statistics depend upon their being so presented as to permit of making comparisons. The fact that 460 deaths occurred in a certain locality during a year is of small interest by itself. If

we also knew that the population of the place during that year was 46,000, giving a death rate of 10 per 1,000, we can compare it with the death rates of other places, and thus find that it was a low death rate. If we also knew that the number of births during the same period was 460, giving a birth rate of 10 per 1,000, we might suppose that there were comparatively few women and children in that town, and few negroes. If we also knew the number of children under 5 years of age, the number of deaths among them, and the number of women between 15 and 50 years of age, we could make further comparisons, and if we found that the proportion of children and of women of child-bearing age was about the same as in most cities, we should probably conclude that the number of births and deaths was too small, and that an adequate system of registration is needed. This last is the conclusion which will be reached by a skilled statistician when considering the number of deaths and births given for the majority of the states, and, therefore, for the United States as a whole, in the Census report on Vital Statistics.

No state has a complete registration of births, the ones that come nearest to it being probably Massachusetts, Rhode Island, and Connecticut, but the results of the registration in these states should be sought, not in the Census report, but in the state reports of births, marriages, and deaths.

The only states which had a registration of deaths sufficiently complete to make the death rates worth calculating were Connecticut, Maine, Massachusetts, Michigan, New Hampshire, New Jersey, New York, and Rhode Island, which, with the District of Columbia, form the group referred to in the Census report as the "registration" states.

No Southern state, and no Western state except Michigan, had any satisfactory system of registering deaths at the time the data were collected. Even in the states classed as registration states the deaths were not all recorded, as was found by a comparison of the returns made by the enumerators with the registration records. The results of this comparison are given on pages xv–xxiii, Volume III, of the Twelfth Census reports.

Some statisticians having ascertained that the Census reports on vital statistics, for the majority of the states, are incomplete and unreliable, and do not enable us to make definite comparisons of the birth and death rates of this country with those given for France, Germany, Great Britain, and other countries having a fairly satisfactory system of registration, conclude that it is hardly worth while to attempt to study or use the data given in the vital statistics of the Census, and that the money expended in their collection and compilation has been wasted. This appears to be an error. There is a large amount of information contained in the census figures which can be brought out by careful study and comparisons with the data of other countries, and if they do not always answer questions, they suggest many interesting lines of research. This is especially the case with regard to the statistics of the causes of death, which, inaccurate and incomplete as they are, contain nevertheless much more information than the published vital statistics of France and Germany, and are only surpassed by those of Great Britain. They can be greatly improved, and by the methods to be used by the permanent Census Bureau they will, no doubt, be greatly improved, but the vital statistics volumes of the Tenth, Eleventh, and Twelfth censuses will always have great value in medicine, in hygiene, and in sociology.

If the historian had a few such reports as these for ancient Greece or Rome, for Italy or France or England in the sixteenth century, or for Asia and Africa of to-day, his sources of information would be enormously increased. In the volumes containing the vital statistics of the Tenth, Eleventh, and Twelfth censuses there is a large amount of information with regard to the relative prevalence of certain causes of death in the Southern and Western states, which is very little known or made use of by physicians, by sociologists, or by local historians, but which will hereafter be shown to be of considerable importance and interest. On the other hand, there are many sources of error in these statistics, and in the ratios derivable from them, which make it necessary to consider the results with caution. In this respect the figures given for the registration area do not differ materially from those for other countries. One of the most important of these sources of error is the number of cases in which the facts sought are unknown to the persons furnishing information to the enumerators or the registrars. This applies especially to the facts relating to conjugal condition and to occupation, both for the living population and for the dead, and it is impossible to compute even approximately reliable life tables on these points from the census data of any country.

To ascertain the effects of a given occupation on health requires a special investigation, but the census data give some valuable suggestions as to the direction which such an investigation should take. The same may be said with regard to the relative prevalence of certain causes of death in different localities, or in different occupations or races. The census figures ask some very interesting questions and indicate probabilities, and, although not scientifically accurate, it is a mistake to assume that they are necessarily so inaccurate as to be unworthy of consideration; most of them are valuable for comparison with other data, and many of them are very suggestive. For example, as Mr. King has pointed out (Twelfth Census, Volume III, page lvii), the death rate for the United States can not be accurately determined, but it was probably between 16 and 17 per 1,000, being less than it was in 1890 by nearly 10 per cent, and less than that of most foreign countries. There has

been a similar decrease in other countries, as is shown by the following table:

TABLE I.—*Comparative death rates per 1,000 population for certain countries.*

COUNTRY.	1890	Twenty-five years, 1876–1900	1900
Austria	29.4	28.6	25.4
Belgium	20.6	20.1	19.3
Denmark	19.0	18.3	16.9
England and Wales	19.5	19.1	18.2
France	22.8	21.9	21.9
German Empire	24.4	24.2	22.1
Prussia	24.0	23.7	21.8
Hungary	32.4	32.3	26.9
Ireland	18.2	18.2	19.6
Italy	26.4	26.5	23.8
Netherlands	20.5	20.3	17.8
Norway	17.9	16.6	15.9
Scotland	19.7	19.2	18.5
Spain	32.5	[1] 30.3	28.7
Sweden	17.1	17.0	16.8
Switzerland	20.8	20.6	19.3
United States (registration area)	19.6	.....	17.8

[1] Average for twenty years, 1878–1884, 1888–1900.

The question as to whether the decrease in mortality in 1900 as compared with 1890 was due to temporary causes, such as the comparative absence of epidemics or more favorable meteorological conditions in 1900, or to permanent causes, such as improved sanitary conditions, is an interesting and important one.

The tables given on pages cxiii–cxv of Volume III, Twelfth Census, indicate that it was due largely to a lessening of the mortality from consumption, diphtheria, and diseases of children, the lower death rates from these causes being considerably more than sufficient to offset the increased mortality from pneumonia, cancer, heart disease, apoplexy, and other diseases of old age. The greatest diminution is in the mortality from consumption, which, in the registration area, was 187.3 per 100,000 of population in 1900, while in 1890 it was 245.4. Within the last ten years much has been done to instruct the public as to the mode by which pulmonary tuberculosis is spread, and as to the proper methods of prevention, and the health departments of most of our large cities have given much attention to this subject. It is very satisfactory to find that the census figures indicate that good results are being obtained.

The following table gives the data for a comparison of the death rates per 1,000 in 1890 and in 1900, for the registration states and the cities in those states, with distinctions of sex and color for each of certain age groups:

TABLE II.—DEATH RATES PER 1,000 POPULATION AT CERTAIN AGES, BY COLOR AND SEX: 1900 AND 1890.

SEX AND COLOR.	REGISTRATION STATES.							CITIES IN REGISTRATION STATES.						
	All ages.	Under 5 years.	5 to 14 years.	15 to 44 years.	45 to 64 years.	65 years and over.	Unknown.	All ages.	Under 5 years.	5 to 14 years.	15 to 44 years.	45 to 64 years.	65 years and over.	Unknown.

An examination of the death rates by ages shows that the diminution of the rates for each class for the ages below 45 is noteworthy.

Probably the most interesting and valuable data contained in the Census report on Vital Statistics are those which relate to municipal mortality statistics. They are, as a rule, more complete and accurate than the mortality statistics of rural and thinly settled districts or of the states taken as a whole. They include localities differing greatly as to climate, and furnish some of the best data we possess for studying certain problems connected with sociology, and the relative prevalence of certain forms of disease in different places.

The tables in the report on Vital Statistics of the Twelfth Census which give the most important information with regard to the registration cities are Table 19, in Part I of the report, and Table 7, in Part II.

The following table, condensed from Table 19, Part I, shows for each registration city the population and the gross death rate, with the death rate per 100,000 of population from each of certain diseases, with distinction of color, for the census year 1900:

TABLE III.—POPULATION AND GROSS DEATH RATE, WITH DEATH RATES FROM CERTAIN PRINCIPAL DISEASES, BY COLOR: CENSUS YEAR 1900.

CITY.	POPULATION.		DEATH RATES PER 1,000 OF POPULATION.		DEATH RATES PER 100,000 OF WHITE POPULATION.

A comparison of the figures in this table will raise many questions that should be of vital interest to the people. St. Paul, with a population of 163,065, gives a death rate of 9.7 per 1,000 for the census year, and Minneapolis, with a population of 202,718, gives a death rate of 10.8, while the average death rate for cities of this size is about 17. If the death rates of St. Paul and Minneapolis are correct, it is a matter of very great interest to other large cities to know the cause of this. Is it due to peculiarities of race and age distribution in the population of these cities? An approximate answer to this question is given in the table on page xc of Part I of the report on Vital Statistics of the Twelfth Census. This table gives for some of the cities of 50,000 population and upward corrected death rates for the native white and colored population based on a standard distribution as to ages, and it should be studied by all who are interested in municipal mortality statistics. This table shows that the corrected death rate for St. Paul, on the basis of the age distribution of the native whites of native parentage, was for native whites of native parentage 11.2, for colored 12.6, and for Minneapolis 12.8 for native whites of native parentage and 21.2 for colored, the standard average for registration cities being 18.3 for native whites of native parentage and 36 for colored. The most probable inference is that all the deaths were not registered in St. Paul and Minneapolis during the census year, and that the figures for these cities are useless for comparison with other cities. The same may be said with regard to the death rates reported for Duluth, Minn., and for Seattle, Wash. On page lviii of Part I of the Twelfth Census report on Vital Statistics is a table giving the death rates of registration cities in 1890 and in 1900, respectively, showing in most cases a diminished death rate.

The comparison of the death rates of a city at ten-year intervals does not give results nearly so valuable or suggestive as does a comparison for a series of consecutive years. To make such comparisons it has been necessary heretofore for the investigator to consult the annual reports of the city, which is often difficult. Many cities do not publish such reports, although the data are recorded, and if results are wanted for a number of cities it becomes impossible to obtain them. Under the permanent organization of the Census Bureau it is proposed to obtain returns from the registration states and cities each year, which will be tabulated in a uniform manner and with considerable detail, and there will thus be formed and published a most valuable collection of data on municipal mortality statistics.

In the meantime, and for the present purpose of supplementing the data given in the Twelfth Census report with some results showing that the apparent decrease in the general death rate pointed out in that report has been real and progressive, in many of the cities probably due to improved methods of sanitation, hygiene, and health regulations, a special collection of data from a considerable number of the principal cities has been made through the courtesy of the registration officials.

The data include the total number of deaths registered in 83 cities of over 25,000 population, during each of the eleven years ending with the year 1900, and also the number of deaths in each year, of children under 5 years of age. This represents nearly all of the important cities in which the officials were able to supply the figures desired.

The figures have been reduced to death rates for each year by computing the population of the intervening years upon the basis of a geometrical progression from 1890 to 1900. It should be noted, therefore, that the death rates so calculated may not agree with the rates that may have been published during that period by the city authorities, as the latter were necessarily based upon an estimated population. The results are given in the following table:

TABLE IV.—POPULATION, DEATHS, AND DEATH RATES PER 1,000 POPULATION AT ALL AGES AND UNDER 5 YEARS OF AGE, IN EACH CALENDAR YEAR FOR CERTAIN SPECIFIED CITIES: 1890 TO 1900.

1900	47,931	810	16.9	5,875	311	52.9

This table shows that there was a general lowering of the death rate in many of these cities during the ten years, and that this lowering was more or less progressive and continuous.

Taking the first city on the list—Albany—it will be seen that the death rate became lower each year after 1895, in which it was 24.8 per 1,000, until 1900, in which it was 19.0 per 1,000. This lowering was marked in the children under 5 years of age.

In the city of Troy the death rate increased from 23.6 in 1890 to 25.2 in 1900. Why has Troy a higher death rate than Albany? The only data given by the census tables for the answer to this question are the figures in Table 19, Volume III, Twelfth Census, showing the number of deaths from each of certain diseases in each registration city. From Table III, pages 496 and 497, we find that for the census year ending in June, 1900, the death rate per 100,000 of white population for consumption was: Albany, 245.3; Troy, 343.7. For typhoid fever the rate was: Albany, 44.1; Troy, 88.0. For diarrheal diseases: Albany, 72.1; Troy, 171.0. Evidently the causes of such great differences in the mortality from these diseases, all of which are more or less preventable, are worthy of careful investigation by the municipal authorities of Troy.

The statistics of the mortality from these diseases in these two cities for a series of years are not available, so that we can not tell whether the year ending June 30, 1900, was one of exceptionally high death rates from these causes in Troy.

To show how these data may be stated in the future under the improved methods of a permanent census, the data for the specified cities for the eleven years 1890-1900 have been obtained and compiled to show the annual death rates for each year for four principal causes of death, viz, consumption, pneumonia, typhoid fever, and diphtheria and croup, and the results are worth careful study.

CONSUMPTION.

Attention has been called above (page 495) to the fact that the lower death rate in 1900 as compared with 1890 is due in part to a lower death rate from consumption.

The following table shows the death rate per 100,000 from consumption in each of the specified cities, by groups according to locality for each of the eleven years 1890–1900, and the average for the whole period:

TABLE V.—ANNUAL DEATH RATES DUE TO CONSUMPTION IN CERTAIN CITIES, PER 100,000 POPULATION: 1890 TO 1900.

[1] Manhattan and Bronx boroughs only.

It will be seen from this table that the average death rate per 100,000 from consumption during this period of eleven years was, for the New England cities, 244, having steadily lessened from 307 in 1890 to 213 in 1899 and 214 in 1900.

In the cities of the Middle states the average death rate from this cause was 259, having fallen from 314 in 1890 to 234 in 1900. In the Southern cities the average rate was 277, having fallen from 316 in 1890 to 252 in 1900. The comparatively high death rates in these cities from this cause is due to the fact that they contain a large number of colored people who are especially liable to this disease. The statistics for the individual cities are especially interesting, but comparisons are left to the reader.

These death rates from consumption in the United States may be compared with the death rates from the same cause in Europe as given in an interesting paper in Zeitschrift für Hygiene, Leipzig, 1904, volume 46, page 543, and summed up in the following table:

TABLE VI.—*Death rates due to consumption in certain European cities.*

[1] Manhattan and Bronx boroughs only.

It will be seen from this table that the death rate from pneumonia in these cities has not diminished, but has, upon the whole, increased during the eleven years in question, being in strong contrast to the death rate from consumption, which has diminished, and this is also true for European countries and cities.

While the specific micro-organism which is the cause of most of the fatal cases reported as due to pneumonia has been known for more than ten years, preventive medicine has not yet developed any satisfactory means of lessening the number of cases of this disease, and no method of treatment has yet been discovered which decidedly influences the mortality in persons attacked by it. Its prevalence in a particular locality appears to be in part influenced by race, negroes and persons of Irish descent showing a high mortality from this cause. The figures on pages ccxvii–ccxxi of Volume III of the Twelfth Census reports, showing the death rates in 1900 from pneumonia in relation to age, sex, color and race, and locality, taken in connection with the corresponding figures in the report for 1890, give information which is not to be found elsewhere, and should be carefully considered by those who are investigating this disease.

TYPHOID FEVER.

The following table shows the death rate per 100,000 from typhoid fever in each of the specified cities, by groups according to locality, for each of the eleven years, with the average for the whole period:

TABLE VIII.—ANNUAL DEATH RATES DUE TO TYPHOID FEVER IN CERTAIN CITIES, PER 100,000 POPULATION: 1890 TO 1900.

San Francisco, Cal	37	50	45	37	34	36	38	31	23	17	52	41

[1] Manhattan and Bronx boroughs only.

The data in this table indicate that there has been some diminution in the death rate from typhoid fever, but that the mortality has varied greatly in different cities in different years, due to epidemic outbreaks of greater or less severity.

The specific cause of typhoid fever is known, and the modes by which it is spread in a community are fairly well understood. It is a preventable disease, but in many cities it is not prevented.

DIPHTHERIA AND CROUP.

The following table shows the death rate per 100,000 from diphtheria and croup in each of the specified cities, by groups according to locality, for each of the eleven years, with the average for the whole period:

TABLE IX.—ANNUAL DEATH RATES DUE TO DIPHTHERIA AND CROUP IN CERTAIN CITIES, PER 100,000 POPULATION: 1890 TO 1900.

CITY.	Average annual rate.	1890	1891	1892	1893	1894	1895	1896	1897	1898	1899	1900

San Francisco, Cal	51	61	151	104	73	24	15	14	33	46	32	23

[1] Manhattan and Bronx boroughs only

It will be seen from this table that the death rates from diphtheria and croup diminished during the eleven years, but that this diminution was by no means systematic and continuous, and that the different cities suffered from epidemics of diphtheria in different years. On the whole, however, there has been a marked diminution in the mortality from this cause for the last five as compared with the first six years of the period, which diminution is probably due quite as much to improved methods of treatment as to sanitary measures.

DISEASES OF OLD AGE.

Allusion has been made above (page 495) to the increased mortality from pneumonia, cancer, heart disease, apoplexy, diseases of the kidney, and other diseases of old age. A similar increase has taken place in European cities. An increased proportion of deaths in old age is of course to be expected whenever the death rates of the young have been lowered for a considerable length of time. So far as we know at present the potential longevity of man is nearly a fixed period of about 100 years. The effects of practical hygiene are to diminish the number of deaths in the first half of this period and thus to preserve and extend the number of lives reaching into the latter half of this period. But the increasing mortality from the diseases of old age in the total population, which is a necessary consequence of progressively improving hygiene, does not necessarily imply an increased mortality in the old age group; that is to say, the death rate of persons between 60 and 70 years of age not only may not increase but may actually diminish, for the simple reason that the proportion of persons of this age group living has increased; and the same may be said with regard to the death rates from particular causes, such as cancer, diseases of the circulatory system, etc., and which specially affect persons advanced in life.

If we compare the death rates from cancer in the registration area of 1890 with that in the registration area of 1900,[1] we find that the death rate from cancer per 100,000 population was 49.1 in 1890 and 60 in 1900. If we take the death rates for the age groups 45 to 64 and 65 and over, we find that in the first group the death rate per 100,000 of population was, in 1890, 162.0, and in 1900, 194.8; and in the second group it was, in 1890, 351.9, and in 1900, 454.3, which shows that there was a marked increase in the death rate from cancer in old age from 1890 to 1900. This increase is well worth more detailed statistical investigation, showing for each of the large cities for each year for a series of years the death rates from cancer in each of certain age groups, with distinctions of sex and color.

Cancer is taken merely as an illustration. The same comparisons should be made for diseases of the brain, of the kidney, of the heart, etc., a matter of great interest and importance in preventive medicine.

If the data for population and deaths were sufficiently complete to permit of the computation of mortality statistics for the United States as a whole and for each individual state, which statistics should be as accurate as those for the principal European countries, the results for such large and diversified areas would be of but little greater interest and value than those we already have. We know that the death rate of the country, taken as a whole, is low, and that there are differences in the death rates of different states amounting to 4 or 5 per thousand for the whites, but these facts do not answer most of the questions which are of the greatest interest in sociology, in political science, in practical hygiene, and in life insurance.

[1] Eleventh Census, Report on Vital and Social Statistics, Part I, page 345; Twelfth Census, Vol. III, page clxxxvi.

EXPECTATION OF LIFE.

The ideal answers to these questions would be an extensive series of life tables which would show for each sex of each race the expectation of life at each age, for each city of, say 10,000 inhabitants and upward, and for each of a certain number of occupations, with corresponding tables for each group, showing the principal causes of death.

We can not compute from the census data life tables of sufficient accuracy for useful comparisons—not even for the states and cities which have a fairly complete registration of deaths—because the data for the number of living persons in each group are not only incomplete and inaccurate, but irregularly so, varying as to accuracy in different cities and in different parts of large cities. The most important of these defects from the life-table point of view is the incomplete enumeration of children under 5 years, and especially under 1 year of age, and the absence of reliable information as to the number of births. While I do not think that the number of living children under 1 year of age not reported by the census enumerators in 1900 was as great as is estimated by Mr. King, i. e., from 25 to 30 per cent (Twelfth Census, Volume III, page liv), there was no doubt a deficiency—and this deficiency was much greater in some localities than in others.

Approximate life tables for a few localities were given in the reports on Vital Statistics in the Tenth and Eleventh censuses, but the time limit fixed for the completion of the Twelfth Census report did not permit the extensive computations necessary. Since that report was published a number of similar tables showing the expectation of life in 1900 have been computed, and the results are given below, in comparison with the corresponding results for the two preceding censuses:

TABLE X.—EXPECTATION OF LIFE IN CERTAIN CITIES AND STATES.

The expectation of life in 1900, as given in the preceding table, was computed according to the method used in the two preceding censuses, for which the figures are also given, which method is described on page cxliii of Volume XII of the Tenth Census reports.

The figures do not have any actuarial or scientific value as indicating the true expectation of life, but they are of some interest for comparison with each other.

THE NEGRO FARMER.

By W. E. Burghardt Du Bois, Ph. D.

FARMS OPERATED BY NEGROES.

Negro farmers are of two classes—those who are operating farms they themselves own and those who are operating farms owned by others. In the first part of the following analysis the question of ownership of the farm is disregarded, the figures including all farms operated by negroes whether owned by them or not. Later the question of tenure is considered, and in this connection the figures relative to farms owned by negroes are separately presented and discussed.

General statistics.—There were in the United States, in 1900, 746,717 farms operated by negroes, of which 716,514 were improved by buildings. These farms contained 38,233,933 acres, or 59,741 square miles, an area about equal to that of the state of Georgia or that of New England; 23,362,798 acres, or 61 per cent of the total area, was improved for farming purposes. The total value of property on these farms was $499,943,734, of which $324,244,397 represented the value of land and improvements, $71,903,315 that of buildings, $18,859,757 that of implements and machinery, and $84,936,265 that of live stock. The gross value of all products on farms of negroes in 1899 was $255,751,145. Of this sum, however, $25,843,443 represents products fed to live stock, the value of which reappears and is to that extent duplicated in the reported value of animal products such as meat, milk, butter, eggs, and poultry; subtracting this amount we have a net value of $229,907,702, or 46 per cent of the total value of farm property in farms cultivated by negroes. This sum represents the gross farm income. The total expenditure for labor on farms of negroes in 1899 was $8,789,792, and the expenditure for fertilizers was $5,614,844.

In considering the significance of these statistics it should be borne in mind that a farm, as defined for census purposes, includes all the land under one management, used for raising crops and pasturing live stock, with the wood lots, swamps, meadows, etc., connected therewith, whether consisting of one tract or of several separate tracts. It also includes the house in which the farmer resides, and all other buildings used by him in connection with his farming operations, together with the land upon which they are located.[1] The land is considered to be under the management of the person who cultivates it, either as owner, hired manager, or tenant. Accordingly, a large plantation owned by 1 person, but leased in small areas to 50 tenants, would ordinarily be returned in the census as 50 farms. Nevertheless, in some sections where the negroes work land as tenants the enumerators reported all the land and crops in the name of the owner or manager, thereby crediting white farmers with values which, according to the census definition, should have been assigned to negro farmers.

The classification of farms by color of farmer was not introduced in the Eleventh Census, and comparisons between 1890 and 1900 are therefore impracticable. But the increase in the number of farms operated by negroes may be measured approximately by comparing the number of such farms or the number of negro private farm families in 1900 with the number of negro (including "mixed") farm families in 1890. For the purpose of this comparison the number of farms operated by negro managers in 1900—1,744 must be excluded, because in 1890 such farms were classified according to the color of the employer, who was generally white. In 1900 there were in continental United States 744,971 farms operated by negro owners and tenants, and 758,463 negro private farm families; on comparing these figures with the number of negro farm families in 1890 (549,632—the resulting percentages of increase are 35.5 and 38, respectively. In 1890 the number of all farm families, including both negro and white, was in excess of the number of all farms, making it probable that the number of negro farm families was likewise greater than the number of farms of negroes. In that case the comparison of negro farm families in 1890 with farms of negroes in 1900 would not adequately represent the increase in the number of such farms. The comparison with the number of private farm families in 1900 also is defective, because the number of farm families in 1890 included families other than private. It is probable, then, that both of the percentages based on the above comparisons fall short of the true percentage of increase. On considering the returns by geographic divisions, it is found that the increase is confined to the two southern divisions, being about 35 per cent in the South Atlantic and about 43 per cent in the South Central; but the figures are too roughly approximate to be worth detailed analysis.

The importance of agriculture as an occupation for the negro in the South is emphasized by the following table, which shows by geographic divisions the proportion negro farm homes form of all negro homes:

[1] Twelfth Census, Vol. V, page xiv.

TABLE I.—*Comparison of negro farm homes with all negro homes: 1900.*

DIVISION.	All homes.	Farm homes.	Per cent farm homes form of all homes.
Continental United States	1,833,759	758,463	41.4
North Atlantic	78,838	1,740	2.2
South Atlantic	761,105	293,512	38.6
North Central	110,932	12,840	11.6
South Central	875,919	450,009	51.4
Western	6,965	362	5.2

These figures show a high percentage of negro farm population in the two southern divisions, which naturally produces a high percentage in continental United States as a whole. In the other divisions—especially the North Atlantic and Western—the percentage is small, indicating that outside the South the negroes are to a large extent congregated in cities, and are engaged in pursuits other than farming.

Number and acreage of farms, by geographic divisions.—The statistics of number and acreage of farms operated by negroes in continental United States are given by geographic divisions in Table II. The totals in this table differ from those given on page 511 by the exclusion of the two farms which are in the territory of Hawaii, and therefore outside the limits of continental United States.

TABLE II.—*Number and acreage of farms of negro farmers: 1900.*

DIVISION.	NUMBER OF FARMS.		ACREAGE.			
	Total.	With buildings.	Total.	Average per farm.	Improved.	Per cent improved.
Continental U. S.	746,715	716,512	38,233,920	51.2	23,362,786	61.1
North Atlantic	1,761	1,724	84,407	47.9	55,079	65.3
South Atlantic	287,933	278,308	15,573,561	54.1	8,874,506	57.0
North Central	12,255	11,665	787,071	64.2	566,073	71.9
South Central	444,429	424,491	21,712,876	48.9	13,846,278	63.8
Western	337	324	76,005	225.5	20,850	27.4

This table confirms very strikingly the fact that the agricultural operations of negroes are confined almost entirely to the two southern divisions of the country, less than 15,000 farms and less than a million acres being reported from other sections; in other words, the Southern states contain more than 98 per cent of all farms operated by negroes and more than 97 per cent of the total acreage of these farms.

In 1900 the average size of farms operated by negroes in continental United States was 51.2 acres; and of the total acreage 61.1 per cent was improved. In the South Atlantic states the average size was 54.1 acres, while in the South Central states it was 48.9 acres; and of the total acreage 57 per cent and 63.8 per cent, respectively, was improved. In the North Central division the farms were larger and had a greater improved acreage than either of two southern divisions, the average size being 64.2 acres, with 71.9 per cent improved. The few farms operated by negroes in the Western division were exceptionally large compared with those in other divisions. The average size was 225.5 acres; nearly one-third of these farms were live stock farms, however, and consequently only 27.4 per cent of the total area was improved. The smallest average was that for the North Atlantic division, 47.9 acres; this, however, was hardly smaller than the average for the South Central.

Number and acreage of farms, by states.—The following table gives the number of farms operated by negroes, with the total acreage, for all states containing over 5,000 such farms.

TABLE III.—*Number and total acreage of farms of negro farmers in every state containing more than 5,000 such farms.*

STATE.	FARMS.			ACREAGE.		
	Number.	Per cent of total number.	Cumulative per cent.	Number of acres.	Per cent of total number.	Cumulative per cent.
Total	746,715	100.0	.....	38,233,920	100.0	.....
Mississippi	128,351	17.2	17.2	5,886,075	15.4	15.4
Alabama	94,069	12.6	29.8	4,719,069	12.3	27.7
South Carolina	85,381	11.4	41.2	3,791,510	9.9	37.6
Georgia	82,822	11.1	52.3	5,474,889	14.3	51.9
Texas	65,472	8.8	61.1	3,835,979	10.0	61.9
Louisiana	58,096	7.8	68.9	2,343,365	6.1	68.0
North Carolina	53,996	7.2	76.1	2,894,210	7.6	75.6
Arkansas	46,978	6.3	82.4	2,303,336	6.0	81.6
Virginia	44,795	6.0	88.4	2,227,198	5.8	87.4
Tennessee	33,883	4.5	92.9	1,549,683	4.1	91.5
Florida	13,521	1.8	94.7	717,028	1.9	93.4
Kentucky	11,227	1.5	96.2	446,995	1.2	94.6
Maryland	5,842	0.8	97.0	374,276	1.0	95.6
All other states	22,282	3.0	100.0	1,670,347	4.4	100.0

The list of states in this table includes every state in the South Atlantic and South Central divisions, except West Virginia, the District of Columbia, Delaware, Oklahoma, and Indian Territory. The District of Columbia has only 17 negro farmers; West Virginia has 742; Delaware, 817; Oklahoma, 2,256; and Indian Territory, 4,097. Outside these southern divisions there are 4 states, viz, Indiana, Illinois, Kansas, and Ohio, each of which has between one and two thousand negro farmers, or more than Delaware; and there is one state, Missouri, which has 4,950 negro farmers, or more than Indian Territory.

Over one-half of all farms cultivated by negroes in continental United States are found in the four states of Mississippi, South Carolina, Alabama, and Georgia.

In the several states of the two southern divisions, excluding the District of Columbia, Indian Territory, and Oklahoma, the average size of farms operated by negroes ranged from about 40 acres in Kentucky and Louisiana to 66 acres in Georgia,[1] and the per cent of the total acreage which was improved ranged from 49.7 in North Carolina to 76.3 in Kentucky.[2] Outside of Kentucky, however, the percentage of improved land did not exceed 67.1 in any of these Southern states. In general, then, from one-half to two-thirds of the land in the farms operated by negroes in the South was improved. In the North Central division there were only five states -Ohio, Indiana, Illinois, Missouri, and Kansas—which reported, in 1900, more than 1,000 farms

[1] See Table LXIII.
[2] See Table XLV.

operated by negroes; the average size of these farms ranged from 50 to 97 acres, or, excluding Kansas, from 50 to 56 acres, and the percentage of improved land ranged from 68 to about 81. It is worthy of note that these five states were the only ones in this division in which negroes formed more than 1 per cent of the total population in 1900.

Farms classified by area.—The following table shows by geographic divisions the classification of farms of negro farmers according to area:

TABLE IV.—*Farms of negro farmers, classified according to area: 1900.*

NUMBER OF FARMS IN EACH CLASS.

CLASS OF FARMS.	Continental United States.	North Atlantic division.	South Atlantic division.	North Central division.	South Central division.	Western division.
All farms	746,715	1,761	287,933	12,255	444,429	337

The usual farm of the negro has an area of from 20 to 50 acres—the "one-mule farm"—requiring the labor of a man and his family and one mule. Nearly half of the farms operated by negroes in the country in 1900 were of this size. Next in number, were farms of from 50 to 100 acres—the "two-mule farms"—forming 18 per cent of the total. Then came farms of from 10 to 20 acres, followed by the farms of from 100 to 175 acres. Farms under 20 acres, representing largely market gardens and the smaller cotton farms, constituted 23.4 per cent of the total number; farms of 100 acres and over, 12.7 per cent.

In the South Atlantic division the farms showed greater diversity of area than in the South Central, the concentration in the group of 20 to 50 acres being much less marked in the former division, while the proportion of farms under 10 acres and of farms over 50 acres was considerably greater. In the North Atlantic division a still smaller proportion of the comparatively few farms operated by negroes came within the area group 20 to 50 acres, while farms of less than 10 acres and those of over 50 acres were relatively more numerous; in the North Central states the distribution of the farms of negroes by area approached more closely to that in the South.

In respect to size of farms the Western division differs greatly from the other four, the most usual size being from 100 to 175 acres. But the actual number of farms in this division operated by negroes in 1900 was small.

Value of farm property.—The value of property on farms operated by negroes in 1900 is given in detail in the following table:

TABLE V.—VALUE OF PROPERTY ON FARMS OF NEGRO FARMERS: 1900.

DIVISION.	VALUE OF FARM PROPERTY.					PER CENT OF TOTAL VALUE OF ALL FARM PROPERTY.				AVERAGE VALUE PER FARM.				
	Total.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	All farm property.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.
Continental U.S.	$499,941,234	$324,242,997	$71,902,265	$18,859,757	$84,936,215	64.8	14.4	3.8	17.0	$669	$434	$96	$25	$114
North Atlantic	4,776,245	2,664,718	1,465,500	206,777	439,250	55.8	30.7	4.3	9.2	2,712	1,513	832	117	250
South Atlantic	162,841,284	106,251,076	26,658,379	5,879,229	24,052,600	65.2	16.4	3.6	14.8	566	369	93	20	84
North Central	24,608,045	17,926,162	2,933,377	723,125	3,025,381	72.9	11.9	2.9	12.3	2,008	1,463	239	59	247
South Central	306,665,271	196,682,266	40,734,135	12,014,612	57,234,258	64.1	13.3	3.9	18.7	690	443	91	27	129
Western	1,050,389	718,775	110,874	36,014	184,726	68.4	10.6	3.4	17.6	3,117	2,133	329	107	548

As shown in this table the farms cultivated by negroes in continental United States represent farm property having a total value of half a billion dollars. Land and improvements other than buildings constitutes 64.8 per cent, or more than three-fifths of this total; the next largest item is that of live stock, which constitutes 17 per cent, or more than one-sixth of the total; then that of buildings, constituting 14.4 per cent, or one-seventh; and lastly, implements and machinery, representing a small fraction only. The proportion of the total value of farm property comprised in the value of buildings is much larger in the North Atlantic states than in any other division. Naturally, in the matter of farm buildings, the requirements in a state like Vermont differ greatly from those in Mississippi, the rigorous climate of the North demanding well-constructed shelter for both man and beast, while in the South less protection is needed. Live stock attains its greatest importance, as compared with the total farm value, in the South Central and Western divisions.

The average values of farm property are decidedly higher in the North Atlantic, North Central, and Western divisions than in either of the southern divisions, and since in the North and West the majority of negro farmers own their farms, while in the South three-fourths of them are tenants, the comparison indicates that the northern negro is a more prosperous farmer than his southern brother. Probably the great majority of the northern and western negroes are immigrants from the South or the children of immigrants, and their greater prosperity may be attributed in part to the native enterprise which led them to migrate, and in part to the influence of a new environment in which they are brought more directly in contact with the example and the competition of the white farmer.

The differences between the two southern divisions are comparatively slight, but they indicate a greater average farm value in the South Central division, with poorer buildings, however, than in the South Atlantic.

The percentages for the Western division suggest similarity between this and the two southern divisions, but the averages reveal enormous differences. The apparent advantage of the West is due, however, to the very large acreage per farm, only a small proportion of which was improved. The relatively very large value of live stock per farm in the Western division is due to the fact that three-tenths of all the western farms operated by negroes are live stock farms; in the two northern divisions, also, the averages are affected by this cause, though not quite so conspicuously.

The farm home.—Emancipation made some change in the home life of the negro, but it was not a radical one. In the back districts, where the new order penetrated but little, it was scarcely noticeable; the "big house" and the quarters remained, but the latter were often worse than before, on account of deterioration and the failure to make repairs. Many masters entered into contracts with their freed slaves, who worked on as hired laborers. It was very difficult, however, to check the roving instinct of a people fired, by newly acquired freedom, with new thoughts and new ambitions. The attractions of town life were very great to the freedman; his few holidays and stolen pleasures in the past had centered there, and thus the picture of congregated life in town represented to him a long-cherished ideal of liberty, while the prospect of life on the old plantation, pursuing the same dull round of toil, had little attraction. To some extent laborers were induced to remain on farms by offers of higher wages and better houses; and thus frame cabins with board floors gradually replaced the worst of the slave quarters.

One impulse toward better housing in the country came from the new negro landowners. Immediately after emancipation the negroes began buying land, and in many instances the new peasant proprietor made efforts to improve the condition of his dwelling. He could not, of course, think of building a big house like that occupied by his former master, and, in default of any other models to follow, he naturally built a slave cabin with some improvements, such as putting a porch on the front, cutting one or two windows, and adding a lean-to at the back for a bedroom. If he went further than this in the number of rooms, or introduced new furniture, the chances are that he got his ideas from friends who lived in town. Many of the freed slaves who had migrated to town and found work as mechanics or laborers lived in frame houses of two, three, or four rooms. From these patterns the negroes learned, and two and three room houses appeared here and there in the country. In the course of time, then, some progress has been made. The dirt floor has practically disappeared, a large proportion of the log cabins have been replaced by frame houses, and glass windows have been introduced here and there. But, on the whole, the improvement is slow. The one-room cabin is still the typical farm home of the negro. Fully one-third of the negroes on farms live in dwellings of this character.

Of course this kind of dwelling has no peculiarly intimate connection with the negro nor with the South, being the primitive form of dwelling of all men and races: the cave dwellers, the French peasants, the American Indians, and the American pioneers all lived in one-room homes. Under certain conditions of life such houses may be fairly comfortable: given a man and wife, the necessity for economy of heat, an active outdoor life, and a scarcity of the finer sort of building material, there can be no better home than the old roomy log hut, with its great fireplace. But an increase in the number of inmates, a decrease in the size of the house, or a change in the manner of life can easily transform this kind of home into a veritable pesthouse. This has been exactly the history of the one-room negro cabin. In it large families of children grow to maturity, under unhealthy conditions and poor moral restraint at best.

The great obstacle to home-making among negroes is, of course, their own training and ideals. Their African

development was cut off suddenly by transportation to the United States; and their training under slavery was not such as to make the masses comprehend the meaning of the best type of family life. It is, therefore, peculiarly hopeful to note the improvement in housing which recent years have brought.

The farm equipment.—Naturally when the farmer is poorly housed the beast often is not housed at all, and proper storehouses for crops are usually wanting.

Farm tools and implements on farms operated by negroes are few in number, old fashioned, and very simple. The indispensable implement is the hoe, supplemented by hand muscle; the one-mule plow is needed, but is not indispensable. Outside of these, negroes have very little machinery and few implements. Reapers and mowers are seldom found. There are a few cotton gins, but the utilization of steampower and the introduction of the automatic system of handling seed cotton have crowded most of the small gins out of business.

Live stock on farms.—The value of live stock on farms includes that of domestic animals, poultry, and bees. The values of these classes of live stock on farms of negroes in 1900, by geographic divisions, were as follows:

TABLE VI.—VALUE OF SPECIFIED CLASSES OF LIVE STOCK ON FARMS OF NEGRO FARMERS: 1900.

DIVISION.	Total number of farms.	ALL LIVE STOCK.		DOMESTIC ANIMALS.				POULTRY.				BEES.			
		Value.	Per cent of total value.	Farms reporting.		Value.		Farms reporting.		Value.		Farms reporting.		Value.

South Central	444,429	57,234,258	67.4	411,899	92.7	54,694,830	132.79	358,147	80.6	2,431,022	6.79	17,078	3.8	108,406	6.35
Western	337	184,726	0.2	319	94.7	177,935	557.79	233	69.1	6,295	27.02	13	3.9	496	38.15

In 1900 about nine-tenths of all farms operated by negroes in continental United States reported domestic animals, and about eight-tenths reported poultry. The South Central division reported about two-thirds of all capital invested in live stock. For each class of live stock the highest average value per farm is shown for the Western division, followed in order by the North Atlantic and North Central divisions, which are far above the averages for continental United States; the South Central, which is a little above; and the South Atlantic, which is considerably below.

The numbers of specified domestic animals on farms of negroes in continental United States in 1900, with the number of farms reporting each kind of animal, were as follows:

TABLE VII.—*Domestic animals on farms of negro farmers in continental United States: 1900.*

DOMESTIC ANIMALS.	FARMS REPORTING.		NUMBER OF ANIMALS	
	Number.	Per cent of all farms.	Total.	Average per farm reporting.
Neat cattle	401,151	53.7	1,457,608	3.6
Dairy cows	341,747	45.8	553,101	1.6
Horses	342,382	45.9	576,526	1.7
Mules	347,214	46.5	502,367	1.4
Asses and burros	867	0.1	1,424	1.6
Sheep[1]	5,672	0.8	97,550	17.2
Swine	513,130	68.7	2,968,074	5.8
Goats	9,055	1.2	62,688	6.9

[1] Including lambs.

It is evident that on farms of negro farmers, swine are more common than any other domestic animals, being reported for more than two-thirds of the total number of such farms. Dairy cows were reported for rather less than one-half of the farms, and the average number indicates that comparatively few of the farms reporting could have had more than two dairy cows, the majority probably having only one. The figures for mules and horses are about the same as those for dairy cows. Only a very small number of farms reported other domestic animals.

There is an understatement of the number of negro farms reporting mules and horses, due to the fact that mules and horses on many farms operated by negro tenants were owned by the proprietor of the land, and were reported by him on his own farm. Moreover, since the proprietor was in almost all cases a white man this reduced the number of these animals credited to the farms of negroes.

The following table presents by geographic divisions the per cent of farms reporting the specified kinds of domestic animals with the average number per farm and the per cent of the total number in each division:

TABLE VIII.—*Per cent of the farms of negro farmers reporting specified domestic animals, with the average number of animals per farm and the per cent of the total number in each geographic division: 1900.*

Western	0.3	0.1	0.3	(2)	1.2	0.7	0.1	0.2

[1] Including lambs. [2] Less than one-tenth of 1 per cent.

The proportion of the farms operated by negroes reporting dairy cows and the proportion reporting neat cattle varied, for the several divisions, only from two-fifths to three-fifths. The farms reporting neat cattle, but not reporting dairy cows, were comparatively few, and probably represent, in the main, live stock farms. The average number of all neat cattle, per farm reporting, was much greater than the average number of dairy cows, the contrast being especially marked in the Western division, which showed a very high average for all neat cattle.

In the North and West a large proportion—more than four-fifths—of the farms operated by negroes reported horses, while but few farms reported mules; in the southern divisions, where the mule is the chief beast of burden, the proportion of farms reporting horses was much smaller, and was exceeded—though but slightly—by the proportion reporting mules. The average number of horses, per farm reporting, slightly exceeded that of mules in every division except the South Atlantic, where there was no difference; but it is very possible that this fact reflects not so much the more extensive use of the horse as the superior endurance of the mule, making it possible for a smaller number to do the same work.

Swine were reported in 1900 by over two-thirds of all farms in the South. The North Central division also shows a high percentage. The figures for the other divisions are slightly lower.

For every kind of domestic animal the Western division shows the highest average per farm reporting, while the lowest average is in most cases that shown for the South Atlantic.

The South reported more than nine-tenths of the total number of each kind of domestic animal except sheep, of which it reported four-fifths; approximately, two-thirds or more of each kind reported by any considerable number of farms are found in the South Central division, and somewhat less than one-third in the South Atlantic.

The absence of common pasture greatly decreases the amount of stock on farms operated by negroes. The tenants hire little pasture land and put all available soil into cultivation. For some years stock was allowed to roam by the roadside, but "fence laws" in many counties have in recent years held the owners of such stock liable for damage done to unfenced crops, and the custom has declined.

Value of farm products.—The statistics of value of products of 1899 on farms operated by negroes in continental United States, by geographic divisions, were as follows:

TABLE IX.—VALUE OF PRODUCTS OF 1899 ON FARMS OF NEGRO FARMERS.

DIVISION.	VALUE OF PRODUCTS.		Per cent not fed, to value of farm property.	AVERAGE VALUE PER FARM.		AVERAGE VALUE PER ACRE.		AVERAGE VALUE PER ACRE OF IMPROVED LAND.	
	Total.	Not fed to live stock.		Total.	Not fed to live stock.	Total.	Not fed to live stock.	Total.	Not fed to live stock.
Continental United States.....	$255,750,435	$229,906,992	46.0	$342	$308	$6.69	$6.01	$10.95	$9.84
North Atlantic	901,799	685,429	14.3	512	388	10.68	8.10	16.37	12.41
South Atlantic	87,413,897	79,095,096	48.6	304	275	5.61	5.08	9.85	8.91
North Central	5,442,806	4,238,808	17.2	444	346	6.92	5.39	9.62	7.49
South Central	161,784,899	145,718,128	47.5	364	328	7.45	6.71	11.68	10.52
Western	207,034	171,531	16.3	614	509	2.72	2.26	9.93	8.23

The average value of products per farm is considerably higher in the northern divisions than in the southern, and somewhat higher in the South Central division than in the South Atlantic. In this respect the rank of the several divisions corresponds precisely with their rank in respect to the average value of farm property shown in Table v.

It would perhaps be expected that the most valuable farms would produce the highest value of farm products. But a comparison of the census figures by states fails to bring out any such relationship. If a comparison be made for the Southern states as regards these two factors it will be found, for instance, that the average value of the negro's farm is higher in Virginia than in Alabama, while the average value of his farm products is lower, and that Mississippi, which ranks second among

Southern states in the average value of products per farm, ranks eleventh in the average value of farm property. The principle that the greater the value of the products or gross income the greater the value of the farm may hold good of farms in the same locality, but apparently it does not apply to farms located in different states or sections, which represent, it may be, radical differences in crops, methods, and costs of farming and other conditions. Nor does the value of products constitute a reliable index of the economic condition of the farmer. It represents only the gross income, out of which come rent, if the farmer is a tenant, and the expenses of operating the farm.

The productivity of farms of negroes as measured by the average value of products per acre is highest in the North Atlantic division; the South Central division ranks next to the North Atlantic in this respect and shows averages considerably higher than those for the South Atlantic.

On farms in the South a small percentage of return in products may sometimes be a distinct sign of prosperity; the land owned by negroes is usually the less fertile, worn-out tracts, and in such cases it is possible that a negro farmer puts a large part of his effort into restoring the soil and making permanent improvements in buildings, fences, etc. The result would be smaller and less valuable crops but a better and more valuable farm which would in time yield better returns than the tenant farm, where the object is to get the largest present crop.

So, too, in the North this relatively low "per cent not fed to value of farm property" probably reflects the fact that a considerable part of the higher farm values in that region represents permanent improvements, which yield a small but continuous return. In general it will be found that this percentage shows a tendency to decrease as the average value of farm property increases.[1]

Farms classified by value of products.—In the following table the farms operated by negroes in continental United States and in the main geographic divisions are classified by the value of products of 1899 not fed to live stock:

TABLE X.—*Farms of negro farmers classified according to gross income, or value of products of 1899 not fed to live stock.*

NUMBER OF FARMS IN EACH CLASS.

CLASS OF FARMS.	Continental United States.	North Atlantic division.	South Atlantic division.	North Central division.	South Central division.	Western division.
All farms	746,715	1,761	287,933	12,255	444,429	337
Farms reporting a gross income of—						
$0	10,379	12	2,420	138	7,792	17
$1 and under $50	50,794	95	27,170	792	22,709	28
$50 and under $100	73,015	213	38,329	1,544	32,898	31
$100 and under $250	247,477	598	102,225	4,169	140,391	91
$250 and under $500	254,490	432	87,552	3,199	163,233	74
$500 and under $1,000	95,505	270	26,498	1,690	66,996	51
$1,000 and under $2,500	14,220	127	3,538	653	9,867	35
$2,500 and over	835	14	201	70	540	10

[1] See Table XLV, giving figures by states.

TABLE X.—*Farms of negro farmers classified according to gross income, or value of products of 1899 not fed to live stock*—Continued.

PER CENT WHICH NUMBER OF FARMS IN EACH CLASS FORMS OF TOTAL NUMBER.

CLASS OF FARMS.	Continental United States.	North Atlantic division.	South Atlantic division.	North Central division.	South Central division.	Western division.
All farms	100.0	100.0	100.0	100.0	100.0	100.0
Farms reporting a gross income of—						
$0	1.4	0.7	0.9	1.1	1.8	5.0
$1 and under $50	6.8	5.4	9.4	6.5	5.1	8.3
$50 and under $100	9.8	12.1	13.3	12.6	7.4	9.2
$100 and under $250	33.1	34.0	35.5	34.0	31.6	27.0
$250 and under $500	34.1	24.5	30.4	26.1	36.7	22.0
$500 and under $1,000	12.8	15.3	9.2	13.8	15.1	15.1
$1,000 and under $2,500	1.9	7.2	1.2	5.3	2.2	10.4
$2,500 and over	0.1	0.8	0.1	0.6	0.1	3.0

On one-third of the farms operated by negroes the reported value of products not fed to live stock was between $100 and $250; on another third it was between $250 and $500. The majority of the farms composing the remaining third yielded less than $100, but a considerable number—rather more than one-seventh of all farms—yielded over $500. The return of farms without income covers accidents, crop failures, crop liens, and certain defects in the reports of the enumerators.

In every division—except the Western—more than half the farms were in the two groups reporting an income of between $100 and $500; but this concentration was most marked in the two southern divisions, in each of which these groups included two-thirds of the total number of farms.

The most productive farms—those yielding over $500—constituted a larger proportion of the total number in each of the northern divisions and also in the western division, than in either of the southern; but the farms yielding incomes under $100, while more numerous in proportion to the total number in the northern divisions than in the South Central division, were most numerous in the South Atlantic division, where they constituted over one-fifth of all farms.

Comparing the two southern divisions, we find that each of the four groups of farms yielding over $250 was represented by a larger percentage in the South Central division than in the South Atlantic, and that the total number of farms in these groups makes up 54.3 per cent of all farms in the former division and 40.9 per cent in the latter.

Crops.—The acreage and production of the principal crops raised on farms of negro farmers in 1899 were as follows:

TABLE XI.—*Acreage and production of specified crops on farms of negro farmers in continental United States: 1899.*

CROP.	FARMS REPORTING.		ACRES.		QUANTITY PRODUCED.		
	Number.	Per cent of all farms.	Total.	Average per farm.	Unit of measure.	Total.	Average per acre.
Cotton	566,180	75.8	9,623,301	17.0	Bales	3,707,881	0.4
Corn	673,885	90.2	7,055,084	10.5	Bushels.	99,512,692	14.1
Wheat	76,140	10.2	470,630	6.2	Bushels.	3,669,475	7.8
Hay and forage	232,918	31.2	312,118	1.3	Tons	367,809	1.2
Oats	64,737	8.7	269,254	4.2	Bushels.	3,356,367	12.5
Tobacco	40,262	5.4	143,271	3.6	Pounds.	88,179,141	615.5
Sweet potatoes	244,620	32.8	133,118	0.5	Bushels.	8,969,524	67.4
Rice	22,641	3.0	48,834	2.2	Pounds.	23,367,482	478.5
Potatoes	70,797	9.5	35,744	0.5	Bushels.	2,440,275	68.3
Rye	2,111	0.3	7,570	3.6	Bushels.	56,827	7.5
Barley	302	(1)	3,063	10.1	Bushels.	58,610	19.1
Buckwheat	603	0.1	1,649	2.7	Bushels.	19,313	11.7

[1] Less than one-tenth of 1 per cent.

In this table the crops have been arranged in the order of their total acreage. If the order of the number of farms reporting were used, the rank of corn, sweet potatoes, and hay and forage would be higher.

Of all crops raised on farms operated by negroes cotton is the most important. In the history of the agricultural operations of negroes, however, tobacco in Virginia was the first crop; then came sugar and coffee in the West Indies, and rice in the Carolinas. Cotton became a leading crop in the thirties, when Whitney's cotton gin was introduced. The quantity raised on all farms increased from eight hundred million pounds in 1840 to a billion in 1850 and two billions in 1860. During the Civil War cotton planting was, of course, suspended. Immediately afterwards, however, it began again with renewed vigor, for the high price of this staple forced all the agricultural energies of the South into cotton culture, leading to an extensive use of land stimulants, and causing neglect of nearly all other crops—even food supplies for man and beast. At first, cottonseed and guano were used to some extent for fertilizers, then concentrated manufactured fertilizers.

Farms classified by principal source of income. An interesting study is furnished by classifying farms according to the crop (if any) the value of which in 1899 constituted at least 40 per cent of the total value of products. All farms not deriving that proportion of their total income from any one crop are classified as "miscellaneous." Such figures must be carefully interpreted, however, or they will become misleading, for only the principal crop is considered, and the aggregate value of a given crop on farms on which it is a subsidiary product sometimes exceeds the aggregate value of the same crop on farms on which it forms 40 per cent of the total income; for example, the aggregate value of corn produced on cotton farms far exceeds that of corn on corn farms. On most of the cotton farms corn and potatoes also are raised, and mules and swine are kept. Tobacco, while the principal crop on but few farms, is a subsidiary crop of considerable importance on a great many.

The classification of farms operated by negroes in continental United States by principal source of income in 1899 is given by geographic divisions in the following table:

TABLE XII.—*Farms of negro farmers classified according to principal source of income in 1899.*

NUMBER OF FARMS IN EACH CLASS.

CLASS OF FARMS.	Continental United States.	North Atlantic division.	South Atlantic division.	North Central division.	South Central division.	Western division.
All farms	746,715	1,761	287,933	12,255	444,429	337

[1] Less than one-tenth of 1 per cent.

The several divisions differ greatly, of course, in the kind of principal crop reported. In the South Central division four-fifths of all farms are cotton farms. In the South Atlantic there is somewhat greater diversity, cotton farms forming a little less than three-fifths of the total; but even here there is no other single crop returned as the principal crop for one-tenth of all farms in the division. In the North Central states, hay and grain farms and live stock farms are of about equal importance, together constituting about two-thirds of the total. In the West there is considerable concentration on the same two classes, which form over half of the total. In the North Atlantic states the greatest diversity is found, the principal classes of farms being, in the order of their importance, miscellaneous, live stock, vegetable, hay and grain, and dairy farms. For continental United States, as a whole, the principal crop is usually cotton, the cotton farms constituting seven-tenths of all farms; next in rank are miscellaneous farms and then hay and grain farms, constituting respectively 12.4 per cent and 6.9 per cent of the total number.

As the presence of a large miscellaneous class implies the absence of specialization, it is of some interest to compare the several sections in this respect. The South Central division, which is preeminently the region of the cotton plantation, shows by far the smallest percentage of farms of this class. In the South Atlantic division the percentage is much higher, nearly equaling that in the North Central division and surpassing that in the Western. The highest percentage is that for the North Atlantic division. In the cotton belt the negro evidently devotes his energies chiefly to cotton. This is partly because of his long training in growing this staple, and because it is a profitable crop; and it is also partly because even when this crop is not as profitable as others, the crop-mortgage system under which the negro tenant works regards cotton alone as proper security, and the tenant must therefore plant it.

A comparison of the number of the farms operated by negroes in continental United States reporting specified crops in 1899 (Table XI), with the number reporting those crops as their principal source of income (Table XII),

shows that nearly all such farms reporting cotton reported it as their principal source of income, while it is evident that the other crops must have been subsidiary products on a large proportion of the farms reporting them.

The following table shows the per cent distribution, in respect to principal source of income, of the farms of negroes in the several Southern states, arranged in the order of the decreasing per cent of cotton farms:

TABLE XIII.—PER CENT DISTRIBUTION OF THE FARMS OF NEGRO FARMERS BY PRINCIPAL SOURCE OF INCOME, FOR THE SOUTHERN STATES AND TERRITORIES.

STATE OR TERRITORY.	PER CENT OF THE FARMS OF NEGRO FARMERS REPORTING AS PRINCIPAL SOURCE OF INCOME—											
	Cotton.	Miscellaneous.	Hay and grain.	Live stock.	Tobacco.	Vegetables.	Dairy produce.	Fruit.	Rice.	Sugar.	Flowers and plants.	Nursery products.

District of Columbia	.....	11.7	.....	.....	.....	64.7	5.9	5.9	.....	.....	11.8	.....

[1] Less than one-tenth of 1 per cent.

The states in the above list form three rather distinct groups as regards the importance of the cotton farm. In the seven states at the head of the list more than three-fourths, or approximately from 80 to 90 per cent, of all farms cultivated by negroes report cotton as the principal crop. These states lie almost entirely within the cotton belt. Then come, in the above list, five states lying on the border of the cotton belt or partially within it. In these states from 40 to 50 per cent of the farms are devoted principally to cotton. Finally, at the foot of the list there are six states, including the District of Columbia, in which practically no cotton is grown; in these states most of the farms operated by negroes are either miscellaneous, hay and grain, live stock, or tobacco farms. The miscellaneous farm attains its greatest relative importance in Virginia and West Virginia, the live stock farms in Maryland and Delaware, and the tobacco farms in Kentucky. In Maryland and Delaware the vegetable farm is of considerable importance, while the few farms in the District of Columbia are mostly of this class.

Expenditures for labor and fertilizers.—The chief items of expense on negro farms are the purchase of seed and tools, the hiring of labor, the buying of fertilizers, and the repair of buildings. Of these the expenditures for labor and fertilizers are perhaps the only items which can be accurately calculated from year to year.

The following table shows the expenditures for labor and fertilizers in continental United States, by geographic divisions, in 1899:

TABLE XIV.—*Expenditures for labor and fertilizers on farms of negro farmers: 1899.*

DIVISION.	TOTAL.		AVERAGE PER FARM.		AVERAGE PER ACRE OF IMPROVED LAND.	
	Labor.	Fertilizers.	Labor.	Fertilizers.	Labor.	Fertilizers.
Continental U.S.	$8,789,792	$5,614,844	$12	$8	$0.38	$0.24
North Atlantic	86,094	28,125	49	16	1.56	0.51
South Atlantic	3,663,841	4,638,977	13	16	0.41	0.52
North Central	242,135	15,717	20	1	0.43	0.03
South Central	4,768,110	930,838	11	2	0.34	0.07
Western	29,612	1,187	88	4	1.42	0.06

On farms of negroes the expenditure for labor is small, because the average farm is just large enough for the labor of one family, needing outside help only in case of emergency.

The average expenditure for labor, both per farm and per acre of improved land, seems to depend upon the wages paid, the agricultural wealth of the section, and the class of farms. The North Atlantic division showed in 1900 the highest average value of property; and it also had a larger proportion of vegetable farms, and therefore of intensive farming, than any other division. Accordingly the average expenditure for labor was very high. In the Western division three-tenths of all negro farms were stock farms, having but little improved land in proportion to their total area, and devoting but little labor to the cultivation of crops; hence the high average expenditure per acre of improved land shown for this division is without much significance in comparison with other divisions. For

the other three divisions the averages per acre differed but slightly from those for continental United States.

The history of the treatment of the soil by both white and negro farmers in the South is simple. At first the plan followed was to wear out the soil by successive crops and then clear new land. This led to a southward and westward movement of land culture, in the path of which, from Virginia to Mississippi, lay a trail of worn-out, waste land. Such land was allowed to rest until the close of the Civil War, when commercial fertilizers were introduced to restore it.

A system of simple crop rotation has now been introduced here and there. Not much use is made of animal manures, as stock is not usually stalled. Although the expenditure for fertilizers is not a very good index of the amount of effort being made to restore the natural powers of the soil, the figures are of considerable value as showing the direction of much of this effort.

The average expenditures for fertilizers show very high figures for the Atlantic states and very low ones for the Central and the Western. This may be due in part to a difference in the character of farming, but the principal explanation is probably to be found in the worn-out condition of the land in the East, referred to above.

Geographic distribution.—The differences between the several geographic divisions in the conditions surrounding the negro farmer as described in the preceding pages are virtually summarized in Table xv, which shows, for each item, the per cent distribution of the total for continental United States by geographic divisions. This table makes it possible to determine whether, in any division, the proportion for a given item is greater or less than that division's proportion of the total number of negro farms. For example, the South Central division reported 59.5 per cent of all farms operated by negroes, and only 56.7 per cent of the total value of buildings on such farms; hence the negro's investment in buildings in the South Central division is relatively low.

TABLE XV.—PER CENT DISTRIBUTION, BY GEOGRAPHIC DIVISIONS, OF THE TOTAL NUMBER OF FARMS OF NEGRO FARMERS, TOTAL ACREAGE, TOTAL VALUES OF FARM PROPERTY AND PRODUCTS, AND TOTAL EXPENDITURES FOR LABOR AND FERTILIZERS.

PER CENT DISTRIBUTION.

DIVISION.	Total number of farms.	Acreage.		Value of farm property.					Value of products of 1899 not fed to live stock.	Expenditures: 1899.

(1) Less than one-tenth of 1 per cent.

THE NEGRO TENANT.

Classification of farms by tenure.—Conditions of farm tenure have much to do, of course, with farm methods in general. In the reports of the Twelfth Census six different varieties of tenure are distinguished and used as a basis for classification of farm statistics. They comprise farms operated by owners, by part owners, by owners and tenants, by managers, by cash tenants, and by share tenants. The terms here used may be defined as follows: "Owners" in the narrower sense of the term are those farmers owning all the land comprised in their farms; "part owners" are those owning a part of the land in their farms and renting a part; the term "owners and tenants" is used to designate farmers jointly cultivating the same farm, one owning the land, or a part of it, and the other or others owning no part, but receiving for supervision or labor a share of the products; "managers" are persons employed by the owner to cultivate the farm in return for a fixed salary; "cash tenants" are farmers paying for the use of the land a cash rental or a fixed amount of labor or farm produce; "share tenants" pay as rental a stated share of the products.

The farms operated by owners, part owners, and owners and tenants may be regarded as constituting the owned farms, those operated by cash or share tenants constituting, of course, the rented farms. Of the 746,715 farms of negroes in continental United States in 1900, 187,797, or 25.2 per cent of the total, were owned farms, and 557,174, or 74.6 per cent, rented farms—the remainder, 1,744, or 0.2 per cent of the total, being operated by managers.

The following table shows the distribution, by tenure, of farms operated by negroes in each main geographic division:

TABLE XVI.—*Farms of negro farmers classified according to tenure.*

DIVISION.	NUMBER OF FARMS OPERATED BY—					
	All classes.	Owners.	Managers.	Tenants.		
				All.	Cash.	Share.

South Atlantic	100.0	29.3	0.3	70.4	34.9	35.5
North Central	100.0	56.9	0.9	42.2	13.9	28.3
South Central	100.0	21.4	0.1	78.5	38.5	40.0
Western	100.0	76.2	2.1	21.7	7.7	14.0

The percentages of rented farms in 1900 were relatively high in each of the two southern divisions, and somewhat higher in the South Central than in the South Atlantic. Of the comparatively few negro farms in the northern divisions the proportion rented was much smaller.

Clearly the central feature in the southern farm life of the negro race is the tenant class—those half-million black men who hire farms on various terms, and a large proportion of whom stand about midway between slavery and ownership.

Conditions under slavery.—Present conditions in the farm life of the southern negro can be understood only by bringing to mind the historic development. Before the war the southern plantation consisted of the owner, from 20 to 200 slaves, and several hundred acres of land. Directly under the master stood an overseer, who directed the work through several head slaves called "drivers." The rank and file of slaves were divided into house servants, mechanics, and field hands. All over 12 years of age—men, women, and children—worked in some way, children and the old and disabled being given half tasks.

Cotton was the chief crop on these plantations; but rice was largely cultivated in South Carolina, sugar in Louisiana, and tobacco in the more northern states. Grain crops were of minor importance, and the quantities of hay, fruit, and vegetables raised were scarcely sufficient for home consumption.

One of the most striking features in connection with plantations such as these is their large area. Although exact figures are not available, there is evidence to show that they continually increased in size from 1820 to about 1855. As the old lands were gradually worn out, the demand for fresh soil shifted the region of large farms continuously south and west.

The earliest exact figures available are for the censuses of 1850 and 1860. The intervening decade witnessed the zenith of the plantation system and the beginning of its decline. The history of the country during this period is the history of the efforts of the landowners to maintain their economic advantage. The cotton market was favorable, the price rising and remaining high. The region of large farms tended farther and farther southward and westward, and as the worn-out farms of the border states were abandoned for farming purposes many of the slaves upon them were sold, in order to meet the increasing demand for slave labor in the cotton district; thus Maryland, Virginia, North Carolina, Kentucky, Tennessee, and Missouri became the seat of an internal slave trade of large dimensions. The average assessed value of slaves (one-third or one-half lower than the real value) rose from $324 in 1840 to $361 in 1850, and to $505 in 1855.[1] The illicit foreign slave trade, thus encouraged, assumed larger dimensions toward 1860.

Between 1850 and 1860 the average size of the plantations in the cotton growing South increased from 427 to 431 acres; leaving out Texas, whose ranches in 1850 were not really farms, the increase was from 353 to 408 acres, or 15.7 per cent. But during the same period the average size in the border states, where the land had been worked out and the plantation system was being abandoned, decreased from 282 to 258 acres.

Even more striking than the increase in the area of the large southern plantations was the concentration upon them of nearly all the slaves owned in the South. This is shown in the following statement:

Proportions of slave owners and of slaves in the population of the South: 1850 and 1860.

CENSUS YEAR.	PER CENT OWNERS FORM OF—		Per cent slaves form of total population.	Average number of slaves per owner.
	Total population.	White population.		
1860	3.2	5.1	34.5	11
1850	3.7	5.8	34.7	9

These figures show that the slaves formed about one-third of the total population of that section, but that the owners of these slaves formed only between 5 and 6 per cent of the white population and between 3 and 4 per cent of the total population, the proportion being even lower in 1860 than in 1850.

Effect of the Civil War.—This economic system was

[1] Cotton Kingdom, Olmsted.

overthrown by the Civil War. The land wasted by the armies declined in value, a billion and a half of capital invested in slaves disappeared utterly, and the people were left poor and deeply in debt.

In nearly all the states the course of procedure after the war was the same. The old system of planting on a large scale was partially resumed with contract labor and borrowed capital; but the system soon broke down because of the refusal of the freedmen to work under the conditions offered. The result was a compromise between the landed and landless classes, bringing about a metayer or share tenant system.

The share tenant system. -This system showed many forms and variations. In South Carolina a scheme proposed by a negro laborer came into vogue as early as 1866. The laborer was to work for the landowner five days per week, and have a house, rations, 3 acres of land, a mule and plow every other Saturday to work the land, and $16 in money at the end of the year. The payment of money was considered as representing the value of an extra half day per week, thus raising the laborer's proportion of the week to one and one-half days, or one-fourth; his compensation was therefore regarded as equivalent to his board and lodging and one-fourth of the product. This system proved very successful. The second year some of the laborers proposed to work only four days, feed themselves, and take double the land and mule work, without the money. The third year three-day hands came in, furnishing part of their own stock, and as there were others who paid the rent for a house and an acre of land by giving two days' work per week, there were often found on the same plantation various classes of hands working for the owner from two to six days per week.

The most common share system consisted in granting a freed family a piece of land, usually from 40 to 80 acres, and taking a share of the crop as rent. The share of the crop taken depended on what the laborer furnished. If he gave nothing but his labor and that of his family -implements, stock, and food being furnished—the landowner took two-thirds of the crop; if the laborer fed himself, the owner received half of the crop; if the laborer also furnished tools and mule, the owner received from one-fourth to one-third of the crop. The details of this arrangement of course varied according to locality, fertility, crop, and the character of the contracting parties; if the laborer was thrifty and lucky, the rental of the land was eventually fixed at so much cotton or money, and thus the renter, as distinguished from the metayer, appeared.

This system naturally resulted in the cutting up of the large plantations of the South. The almost continuous decrease in the size of farms may be seen from the following table:

TABLE XVII.—*Average area in acres of all farms in the South: 1860 to 1900.*

CENSUS YEAR.	All Southern states.	South Atlantic division.	South Central division.
1900	138.2	108.4	155.4
1890	139.7	133.6	144.0
1880	153.4	157.4	150.6
1870	214.2	241.1	194.4
1860	335.4	352.8	321.3

The average area of farms for the South as a whole decreased from 335.4 acres in 1860 to 138.2 in 1900, or 58.8 per cent; the decrease was noticeably greater in the South Atlantic than in the South Central states.

To a considerable extent this change results from the fact that the large plantation, instead of being operated by the owner as one farm with the aid of slave or hired labor, has been leased in small areas to tenants, each such area constituting a separate farm according to the census definition of the term.

The crop-lien system. -Another result of the share system in the South was the rise of the crop-lien system of credit farming, the understanding of which is absolutely necessary to any intelligent study of the negro tenant farmer.[1]

Suppose that A is a landholder with 1,000 acres in one of the country districts of Georgia, B is a general merchant, and C is a negro with a wife and several half-grown children.

In slavery times the relations of such a group would have been as follows: A owned C and his family; he furnished them shelter, and gave them food and clothing at stated intervals. Such supplies as A did not have on hand he bought of B, usually on credit, paying at harvest time. At this time the business of B was largely wholesale, and he was located at some central point like New Orleans or Savannah.

Directly after emancipation the relations of the three chief factors changed as follows: A, who was almost or quite bankrupt, divided up his plantation and let C and his family work, say 80 acres, on shares. A furnished, as before, food, shelter, tools, stock, and perhaps even clothes; C was to work the land and receive from one-third to one-half of the net proceeds after the cost of the food and clothing advanced by A had been deducted. B, the merchant of whom A bought these supplies on credit, was no longer a wholesale dealer, but a merchant in a neighboring market town of 500 to 1,000 inhabitants, with a small cash capital and a large supply of general merchandise.

This system proved very unsatisfactory. The freedman usually found himself at the end of the season with no surplus or in debt. Moreover, under the lenient

[1] The following description is based on the report on the negro landowner of Georgia, Bulletin No. 35 United States Department of Labor.

laws for the collection of debts in force at that time, the merchant B was peculiarly liable, between master and man, to lose all. As the freedman was the actual producer of the crop, it was clearly to the interest of the merchant to treat directly with him, if only he could get some legal grip upon him and his work. On the other hand, the freedman, seeking to escape from a condition hardly better than the old slavery, turned eagerly from the master to the merchant. The ex-master was not unwilling to enter into any bargain that insured him a fair income from his land. In the rearrangements between 1870 and 1880, therefore, the economic situation became as follows:

A furnished land, shelter, and stock to C. The rent was either a specific part of the crop, a stated number of pounds of cotton per acre, or a fixed money rental. C bought his supplies of food, clothing, etc., directly from B on credit. B, under a set of laws which gradually grew up, secured himself by a mortgage, which constituted a second lien on C's growing crop, A's rent being the first lien. B now became a crossroads merchant who knew how to attract and hold his black customers.

An investigation of the crop-lien system made in connection with the census of 1880 showed that there was an increasing number of laborers seeking credit to enable them to do business on their own account as tenant farmers, and that the majority of such liens were given by this class, mostly for provisions, but to some extent also for fertilizers, mules, and farm implements.

The effect upon the freedman of this new crop-lien system depended on his character and upon attending circumstances. Thrifty negroes in the hands of well-disposed landowners and honest merchants early became independent landholders; shiftless, ignorant negroes in the power of unscrupulous landowners and merchants sank to a condition hardly better than slavery. The mass of negroes between these two extremes fared as chance and the weather permitted. A good season with good prices regularly freed a number from debt and made them landholders; a season poor either in weather or in prices resulted in ruin to many.

But it is without doubt true that as conditions were after the war the crop-lien system was the only door of opportunity opened to the freedmen, and that through this thousands have advanced from penury to land ownership.

Present economic conditions.—The situation of the farming population in the black belt to-day shows four well-defined economic classes representing different stages of advancement toward farm ownership.

There is the farm laborer who receives for his work, at the end of the year, certain fixed wages, varying from $30 to $60. Some receive also a house, perhaps with a garden spot, and have their supplies of food and clothing advanced; in such cases the supplies must be paid for, with interest, out of the money wages. Another class of laborers are contract hands—i. e., laborers paid by the month or year and fed and supplied by the landowner. Such laborers receive from 35 to 40 cents per day during the working season; they are usually unmarried persons, many being women, and when they marry they become metayers, or, occasionally, renters.

The cropper is entirely without capital, even in the limited sense of food or money to keep him from seed-time to harvest; all he furnishes is labor, while the landowner furnishes house, land, stock, tools, and seed. At the end of the year the cropper gets a stipulated portion of the crop; out of his share, however, comes payment, with interest, for food and clothing advanced him during the year. Thus we have a laborer without capital and without wages, and an employer whose capital consists largely of food and other supplies advanced to laborers—an arrangement unsatisfactory to both parties, and in vogue usually on poor land with hard-pressed owners.

Above the cropper comes the metayer, or share tenant, who works the land on his own responsibility, paying rent in cotton and supported by the crop-lien system. The great mass of the negro population is found in this class. After the war this plan attracted the freedmen on account of its larger freedom and its possibilities for making a surplus. If the rent fixed was reasonable, this was an incentive to the tenant to strive; on the other hand, if the rent was too high or if the land deteriorated, the result was to discourage and check the efforts of the tenant.

The renter for fixed money rental belongs in the highest of the emerging classes. The sole advantages possessed by this class are their freedom to choose their crops and the increased responsibility which comes through having money transactions. While some of the renters differ little in condition from the metayers, yet on the whole they are a more intelligent and responsible class, and are the ones who eventually become landowners.

THE NEGRO FARM OWNER.

Proportion of owned farms.—Of the 746,715 farms operated by negroes in continental United States in 1900, 21 per cent were owned entirely, and an additional 4.2 per cent owned in part, by the farmers operating them; in other words, forty years after emancipation 25.2 per cent or about one-fourth of all negro farmers had become landholders.

Of the total negro and mixed farm families reported in 1890, 120,738, or 21.7 per cent owned their farms. In 1900 there were 187,799 farms owned by negroes, which was 25.2 per cent of all farms operated by

negroes. There were 190,111 private farm-owning negro families in 1900 and a somewhat larger number of farm-owning families of all sorts. Thus, while the number of negro farmers probably increased by about 36 or 38 per cent (see page 511), the number of negro owners increased over 57 per cent, and the percentage of ownership increased by 3.5. These percentages, although based on figures which are not entirely comparable, are sufficiently exact to measure approximately the advance toward farm ownership made by the negroes during the decade 1890 to 1900.

In the following table the Southern states are arranged in the order of the decreasing per cent of owned farms:

TABLE XVIII.—*Per cent distribution, by tenure, of the total number of farms of negro farmers in each Southern state: 1900.*

STATE OR TERRITORY.	PER CENT OPERATED BY—				
	Owners.	Managers.	Tenants.		
			All.	Cash.	Share.
West Virginia	72.0	1.1	26.9	9.1	17.8
Oklahoma	71.2	0.3	28.5	7.6	20.9
Virginia	59.2	0.5	40.3	15.4	24.9
Maryland	55.8	1.8	42.4	9.6	32.8
Indian Territory	55.4	0.3	44.3	7.1	37.2
Florida	48.4	0.7	50.9	40.7	10.2
Kentucky	48.0	0.6	51.4	7.0	44.4
Delaware	40.5	1.8	57.7	9.2	48.5
North Carolina	31.2	0.2	68.6	19.0	49.6
Texas	30.7	0.1	69.2	12.9	56.3
District of Columbia	29.4	11.8	58.8	58.8	.....
Tennessee	27.8	0.2	72.0	32.2	39.8
Arkansas	25.4	0.2	74.4	33.7	40.7
South Carolina	22.2	0.2	77.6	49.7	27.9
Mississippi	16.3	0.1	83.6	44.5	39.1
Louisiana	16.1	0.1	83.8	36.5	47.3
Alabama	15.0	0.1	84.9	59.7	25.2
Georgia	13.7	0.3	86.0	41.9	44.1

This table exhibits a wide range in the percentage of ownership in different Southern states. In the states along the northern border of the South, including Virginia, Oklahoma and Indian Territory, and in Florida, the per cent of owned farms is comparatively high, varying from 40.5 in Delaware to 72 in West Virginia. In Georgia, Alabama, Mississippi, and Louisiana the percentage is very low, ranging from 13.7 per cent in Georgia to 16.3 in Mississippi; in South Carolina the percentage is somewhat higher (22.2), but is still below the average for the country. These five states are in the heart of the South; they comprise the greater part of the black belt; in each of them negroes form between 45 and 60 per cent of the total population, and negro farmers between 35 and 60 per cent of all farmers; collectively they contain almost one-half (47.5 per cent) of the total negro population of the United States. In states where negroes are relatively less numerous the percentage of ownership is higher. This suggests the inference that where the negroes are massed, tenancy is the prevailing form of farm tenure; but it is not so clear that we have here a direct relation of cause and effect. These states are all cotton growing states. The massing of negroes, tenant farming, and cotton culture appear to be correlated facts, the first resulting from the last and the second and the last acting as reciprocal cause and effect through the crop-lien system. In Florida, which has a percentage of negro population (43.7) almost as high as that of Georgia (46.7), the percentage of ownership among colored farmers is high (48.4), because of the greater ease of acquiring fertile land in a newly settled state. For the same reason, in Texas, where nine-tenths of the negro farmers make cotton their principal crop, the per cent of ownership (30.7), though not high, is above the average for the country.

If we add a list of the states with the actual number of negro owners in each we have:

Virginia, 26,566.	Tennessee, 9,426.
Mississippi, 21,973.	Louisiana, 9,378.
Texas, 20,139.	Florida, 6,552.
South Carolina, 18,970.	Kentucky, 5,402.
North Carolina, 17,520.	Maryland, 2,262.
Alabama, 14,110.	West Virginia, 534.
Arkansas, 11,941.	Delaware, 332.
Georgia, 11,375.	District of Columbia, 5.

Virginia leads, followed by Mississippi, Texas, and the Carolinas. In all these cases there are obvious reasons for the large number of owners: Virginia had developed slavery furthest and brought a larger body of negroes to a considerable degree of culture and civilization before 1861. It also bore the main brunt of war and the breaking up of estates gave the negroes a chance to buy. The Mississippi bottoms and the rising price of cotton are attracting negro owners, and Texas offers the chances of the free West. North Carolina had a thrifty free negro element, and Government lands were sold on favorable terms in South Carolina.

Total acreage and value of owned farms.—Census statistics of the acreage and value of farms of negro owners as distinguished from other colored owners are not available, because in the reports of the Twelfth Census the returns of the acreage of farms, the value of farm property and products, and the expenditure for labor and fertilizers were tabulated by tenure for farms of colored farmers, but not for farms of negroes alone. The term "colored," as used in the census, includes not only negroes, but Indians, Chinese, Japanese, and Hawaiians. Negroes, however, constitute more than 97 per cent of all colored farmers in continental United States, and almost 99 per cent of all in the Southern states. Accordingly, in considering continental United States or the South as a whole the statistics relative to colored farmers may be accepted as representing practically negro farmers.

The total acreage and total value of farm property comprised in the farms owned by colored farmers are given in Table XIX, together with the total value of farm products and total expenditures for labor and fertilizers. This table gives also the distribution of those totals according to the subclasses of owned farms distinguished in the census classification.

TABLE XIX.—DISTRIBUTION, BY SUBCLASSES OF TENURE, OF THE NUMBER, ACREAGE, VALUE, ETC., OF THE FARMS OF NEGRO, INDIAN, AND MONGOLIAN OWNERS IN CONTINENTAL UNITED STATES: 1900.

CLASS OF OWNERSHIP.	FARMS OF NEGRO OWNERS.		FARMS OF ALL NEGRO, INDIAN, AND MONGOLIAN OWNERS.											
	Number.		Number.		Acreage.			Value of farm property		Value of products of 1899 not fed to live stock.		Expenditures for labor: 1899.		Expenditures for fertilizers: 1899.	
	Number.	Per cent of total for all owners.	Total.	Per cent of total for all owners.	Total.	Per cent of total for all owners.	Per cent improved.	Total.	Per cent of total for all owners.	Total.	Per cent of total for all owners.	Total.	Per cent of total for all owners.	Total.	Per cent of total for all owners.
All owners	187,797	100.0	206,517	100.0	15,976,098	100.0	42.2	$179,796,639	100.0	$57,422,983	100.0	$2,624,595	100.0	$1,197,180	100.0
Owners proper	156,370	83.3	174,434	84.4	13,621,733	85.3	40.5	150,557,251	83.7	47,428,553	82.6	2,095,485	79.9	964,760	80.6
Part owners	29,956	15.9	30,501	14.8	2,205,297	13.8	52.4	27,358,225	15.2	9,431,859	16.4	496,670	18.9	222,210	18.6
Owners and tenants	1,471	0.8	1,582	0.8	149,068	0.9	50.2	1,881,163	1.1	562,571	1.0	32,440	1.2	10,210	0.8

These figures show that in 1900 negro farmers who owned all of the land they cultivated, or "owners proper," formed 83.3 per cent of all negro owners, while part owners and owners and tenants formed 15.9 per cent and 0.8 per cent, respectively. For all colored farmers the percentage of owners proper was slightly larger, and that of part owners slightly smaller, than for negroes alone. It will be noticed that while the percentage of the total acreage held by colored part owners was slightly smaller than their percentage of the number of farms, their percentage of the value of farm property was slightly larger and their percentage of the value of products and of expenditures for labor and fertilizers considerably larger. This indicates that part owners as a class operate smaller but more valuable, productive, and highly cultivated farms than those who own all their land. The few farms of owners and tenants exhibit a similar superiority over the farms of owners proper as regards value of farm property and of products, and expenditures for labor.

The above table represents only the farms cultivated by negro or colored owners, taking no account of the land rented out by negro or colored owners, of which there is a considerable amount, for the custom of subrenting is widespread.

Owned and rented land in farms of owners.—The total area in farms of colored owners in continental United States in 1900 was 15,976,098 acres, or 24,963 square miles. Not all of this land, however, was owned by the farmers cultivating it; in farms of part owners, some of it, as already explained, was rented from other persons as an addition to the owned land. This composite form of tenure, under which the farmer is both owner and tenant, is representative of a method of buying land prevalent among southern negroes. A man first buys 40 acres of land, paying for it in installments; after that is bought—or, more probably, while he is paying for it—he rents a neighboring plot of 40 acres which he conducts as part of his original farm. Thus he is a landowner, but only part owner of the farm under his control. In 1900 there were 30,501 such farms in continental United States conducted by colored farmers, of whom 29,956 were negroes. These farms contained 2,205,297 acres, of which 1,193,413, or an average of 39.1 acres per farm, were owned, and 1,011,884, or an average of 33.2 acres per farm, were rented. In the Southern states there were 28,055 such farms, all of which were reported by negroes.

There is still a further complication of ownership in the case of the few farms conducted jointly by the owner of the land and a tenant who shares the product. In 1900 colored farmers conducted 1,582 such farms, with an area of 149,068 acres, or 94 acres per farm; of these farms, 1,471 were conducted by negroes. The land in such farms partakes of the nature of both owned and rented land (see page 520), but is appropriately classified as owned land in any statement designed to show the extent to which negroes are to be credited with the ownership of the land they cultivate. Observing these distinctions, we find that the total owned land of colored farmers in continental United States in 1900 amounted to 14,964,214 acres, or 23,382 square miles—an area nearly as large as Holland and Belgium—and constituted 35.8 per cent of all the land operated by colored farmers. The figures for continental United States and for the two southern divisions are given in the following table:

TABLE XX.—*Acres of owned and rented land in farms of negro, Indian, and Mongolian owners: 1900.*

TENURE.	Continental United States.	South Atlantic division.	South Central division.
Total	15,976,098	4,427,439	8,931,245
Owned	14,964,214	4,095,720	8,477,013
In farms of owners proper	13,621,733	3,670,737	7,717,407
In farms of part owners and of owners and tenants	1,342,481	424,983	759,606
Rented	1,011,884	331,719	454,232

The per cent which the acreage owned forms of the total acreage in all farms of colored farmers is 35.8 for

continental United States, 26.2 for the South Atlantic states, and 36.9 for the South Central states.

Value of farm property owned by negroes.—The total value of the farm property in the three classes of farms operated by colored owners in the United States (including Hawaii) was $181,116,048. "This sum includes the value of farms, live stock, and implements on farms owned and operated by Indians, Chinese, Japanese, and Hawaiians, as well as by negroes. After making an allowance for such values, if an estimate of the probable total farm wealth of the negro farmers, June 1, 1900, be desired, the value of the live stock on rented farms, of which a large share generally belongs to the tenants, should be added. That value for the colored tenants was $57,167,206. Adding this sum to the preceding total, it appears that the value, June 1, 1900, of the farm property belonging to negroes was approximately $200,000,000, or a little less than $300 for each negro farmer."[1]

This estimate, however, takes no account of property owned by negroes and rented out to either negroes or whites. In the state of Georgia, for instance, according to the tax returns the land held by colored owners in rural districts in 1900 comprised 1,075,073 acres, while according to the Twelfth Census the acreage of land owned by colored farmers was 871,776, or more than 200,000 less. A similar, though smaller, discrepancy appeared in Virginia. It is probable that most of this difference represents land sublet by negro owners to tenants, and accordingly reported in the census among the farms of tenants; therefore we are probably justified in adding 15 per cent to the above estimated value of property owned by negro farmers in continental United States, thus bringing the total up to $230,000,000.

The value of the land in farms of all colored owners in continental United States in 1900—including the value of the supplementary land rented, which, if we assume it to be of the same average value as the rest, amounted to about $7,500,000—was $102,022,601. While some of the land is very good, most of it is poor, being often practically worn out or disadvantageously situated as regards a market.

Of the 206,517 farms of colored owners in continental United States in 1900, 201,106 had buildings, and the value of these was $28,662,167. For farms which had buildings, the average value per farm was $143. This would mean, in the South, a log or plank house of two or three rooms, and two or three outhouses of various kinds.

The value in 1900 of implements and machinery on these farms amounted to $8,352,975. The negro's tools are few and old-fashioned, a plow and a hoe being the indispensables. However, the farms of negro owners are somewhat better equipped than those of tenants, having wagons and here and there a cotton gin, and perhaps a reaper, though that is rarer.

[1] Twelfth Census, Vol. V, page cx.

The value of live stock on these farms in 1900 was $40,758,896. The proportion of this total reported by Indians is greater than their proportion of any other item of farm property, but the negroes own considerable live stock.

Products and expenditures on owned farms.—The gross value of products of 1899 on farms of colored owners in continental United States was $67,132,380; on subtracting the value of products fed to live stock, we have a net value of $57,422,983, or 31.9 per cent of the total value of farm property.

In 1899 colored farm owners expended for labor over $2,500,000, or nearly $13 per farm. At prevailing rates of wages this means the employment of a man, to hoe or pick cotton, or to plant and gather other crops, for about one month in the year. This indicates that the owned farm of the negro is primarily a tract suitable for cultivation by one family. This statement is partially modified, however, by the fact that considerable land is rented out by owners; moreover, it is probable that on the small farms very little labor is hired, the average being maintained by considerable hiring on the larger farms. It is noteworthy that among colored farmers more labor is hired, on the average, by colored tenants than by owners—probably because the farms of tenants, although smaller, have a larger average acreage of improved land than those of owners.

The expenditures for fertilizers on farms of colored owners in 1899 amounted to over a million dollars, thus averaging about $6 per farm.

FARM STATISTICS BY TENURE.

Farms of colored farmers classified by tenure. In comparing the value, acreage, etc., of the farms of the negro farmers in the different classes of tenure it is necessary, for reasons already explained (see page 524), to make use of figures which include farms operated by Mongolian and Indian farmers. The relative importance of the negro farmers as compared with the other colored farmers is shown for the several geographic divisions of the United States in the following table:

TABLE XXI.—*Number and acreage of farms of negro, and of Indian and Mongolian farmers: 1900.*

A.—NUMBER.

DIVISION.	Total number.	FARMS OF NEGRO FARMERS.		FARMS OF INDIAN OR MONGOLIAN FARMERS.	
		Number.	Per cent of total number.	Number.	Per cent of total number.
Continental U. S.	767,764	746,715	97.3	21,049	2.7
North Atlantic	2,140	1,761	82.3	379	17.7
South Atlantic	288,871	287,933	99.7	938	0.3
North Central	16,900	12,255	72.5	4,645	27.5
South Central	451,799	444,429	98.4	7,370	1.6
Western	8,054	337	4.2	7,717	95.8

TABLE XXI.—*Number and acreage of farms of negro, and of Indian and Mongolian farmers: 1900*—Continued.

B.—ACREAGE.

DIVISION.	Total acreage.	FARMS OF NEGRO FARMERS.		FARMS OF INDIAN OR MONGOLIAN FARMERS.	
		Acreage.	Per cent of total acreage.	Acreage.	Per cent of total acreage.
Continental U. S.	41,766,023	38,233,920	91.5	3,532,103	8.5
North Atlantic	107,239	84,407	78.7	22,832	21.3
South Atlantic	15,637,265	15,573,561	99.6	63,704	0.4
North Central	2,211,338	787,071	35.6	1,424,267	64.4
South Central	22,974,781	21,712,876	94.5	1,261,905	5.5
Western	835,400	76,005	9.1	759,395	90.9

In the two southern divisions the colored farmers consist almost entirely of negroes, the number of other colored farmers being so small that it is practically a negligible quantity; accordingly, for these two divisions generalizations in regard to the negroes may be based upon statistics for all colored. In the North Atlantic and North Central states, however, the proportion of other colored is a factor of importance, and in the Western states the number of negroes is small in comparison to the total number of colored. In so far, then, as it may be necessary to use the data for "colored," the discussion by geographic divisions and states will be confined to the South, where 95 per cent of the negro farmers are found, and where negro and colored are practically coextensive and identical; and the Northern and Western states will be taken into consideration only so far as they are represented in the totals for continental United States.

The distribution of farms by tenure has already been presented for the farms operated by negroes (see Table XVI), but since the statistics of acreage and value which follow, relate to all colored farmers it is desirable to have the distribution shown for this class also, although it differs but little from that shown for negro farmers alone. Accordingly, in Table XXII, the number of farms operated by colored farmers in each main class of tenure is given, together with the per cent which the number in each class forms of the total number in all classes. The comparison by geographic divisions in this table and in those which follow is confined to the South, but is presented for the minor as well as the main divisions of that section.

TABLE XXII.—*Farms of negro, Indian, and Mongolian farmers classified according to tenure: 1900.*

DIVISION.	NUMBER OF FARMS OPERATED BY—					
	All classes.	Owners.	Managers.	Tenants.		
				All.	Cash.	Share.
Continental U. S	767,764	206,517	1,824	559,423	271,663	284,760

TABLE XXII.—*Farms of negro, Indian, and Mongolian farmers classified according to tenure: 1900*—Continued.

DIVISION.	PER CENT OPERATED BY—					
	All classes.	Owners.	Managers.	Tenants.		
				All.	Cash.	Share.
Continental U. S	100.0	26.9	0.2	72.9	35.8	37.1
South Atlantic division	100.0	29.5	0.3	70.2	34.8	35.4
Northern South Atlantic	100.0	58.8	0.7	40.5	14.5	26.0
Southern South Atlantic	100.0	23.0	0.3	76.7	39.3	37.4
South Central division	100.0	22.5	0.1	77.4	37.9	39.5
Eastern South Central	100.0	18.6	0.1	81.3	46.7	34.6
Western South Central	100.0	28.1	0.2	71.7	25.0	46.7

A little more than one-fourth of all colored farmers in continental United States are owners, almost three-fourths are tenants, and a very small fraction are managers. A comparison of the figures for the South by minor divisions brings out the fact that in the Northern South Atlantic states the percentage of owners is exceptionally high (58.8), while in the Eastern South Central it is exceptionally low (18.6).

The tenant class of colored farmers in continental United States, is almost equally divided between cash tenants and share tenants, the former constituting a little more and the latter a little less than one-half of the total. This equality is the resultant, however, of counterbalancing inequalities in the different divisions; for in the Northern South Atlantic and Western South Central divisions share tenants predominate, constituting about two-thirds of all tenants, while in the Eastern South Central almost three-fifths of all tenants are cash tenants.

Farm acreage by tenure.—The per cent distribution, by tenure, of the total farm acreage is shown in the following table:

TABLE XXIII.—*Per cent distribution, by tenure, of the total acreage and of the total improved acreage in farms of negro, Indian, and Mongolian farmers: 1900.*

DIVISION.	PER CENT OF THE TOTAL ACREAGE IN FARMS OF—				
	Owners.	Managers.	Tenants.		
			All.	Cash.	Share.
Continental United States	38.3	1.2	60.5	31.6	28.9
South Atlantic division	28.3	1.3	70.4	36.0	34.4
Northern South Atlantic	43.4	1.9	54.7	16.8	37.9
Southern South Atlantic	25.2	1.1	73.7	40.0	33.7
South Central division	38.9	1.0	60.1	32.3	27.8
Eastern South Central	30.4	0.5	69.1	43.9	25.2

DIVISION.	PER CENT OF THE TOTAL IMPROVED ACREAGE IN FARMS OF—				
	Owners.	Managers.	Tenants.		
			All.	Cash.	Share.
Continental United States	27.8	0.6	71.6	35.7	35.9
South Atlantic division	23.6	0.7	75.7	36.9	38.8
Northern South Atlantic	44.6	1.8	53.6	14.6	39.0
Southern South Atlantic	19.6	0.6	79.8	41.0	38.8
South Central division	27.4	0.4	72.2	36.8	35.4
Eastern South Central	20.9	0.3	78.8	48.2	30.6
Western South Central	36.1	0.6	63.3	21.6	41.7

Colored owners, while constituting, in 1900, 26.9 per cent of all colored farmers, cultivated 38.3 per cent of the total farm acreage under colored control, but only 27.8 per cent of the improved acreage. This means that their farms were considerably larger than those of tenants, although comprising but little more improved acreage. The contrast is most marked in the Western South Central states, where the owners, operating 28.1 per cent of all farms, had 49.2 per cent of the total acreage and 36.1 per cent of the improved acreage; in other words, in this division owners had not only a much larger total acreage in proportion to the number of their farms than tenants, but also a considerably larger improved acreage. In the Northern South Atlantic division, on the other hand, the owners' proportion of acreage, both total and improved, fell below their proportion of farms.

The following table gives the percentage which the improved acreage forms of the total acreage for each main class of tenure:

TABLE XXIV.—*Per cent of the total acreage improved in farms of negro, Indian, and Mongolian farmers classified by tenure: 1900.*

DIVISION.	PER CENT OF THE TOTAL ACREAGE IMPROVED IN FARMS OF—				
	Owners.	Managers.	Tenants.		
			All.	Cash.	Share.
Continental United States	42.2	30.1	68.8	65.6	72.3
South Atlantic division	47.4	33.2	61.1	58.3	64.1
Northern South Atlantic	54.1	51.2	61.7	45.8	54.3
Southern South Atlantic	45.0	27.2	62.6	59.4	68.5
South Central division	44.0	26.8	74.8	70.9	79.2
Eastern South Central	44.7	42.8	74.0	71.1	78.9
Western South Central	43.5	21.0	76.2	70.4	79.5

Attention has just been called to the fact that owners, while operating larger farms than tenants, have hardly more improved acreage. It follows, of course, that they have less improved acreage in proportion to the size of their farms. The difference is shown in the above table, the per cent which, in continental United States, the improved land forms of the total acreage being 42.2 for farms of owners and 68.8 for farms of tenants. A similar difference prevails in each of the main and minor geographic divisions of the South, except the Northern South Atlantic, in which the per cent of the total acreage improved on farms of owners slightly exceeds that on farms of tenants. This division, it will be remembered, is exceptional also in showing smaller farms for owners than for tenants. In general, the small farm is more fully improved than the large.

Of the two classes of tenants, cash tenants, operating larger farms than share tenants, have the lower per cent of improved acreage, so that, as regards the percentage of improved land, tenants rank above owners and share tenants above cash tenants. A reason for this difference is stated in the following extract from the Report on Agriculture:[1]

> The very high per cent of improved land in the tenant farms of the South arises from the fact that land in that section is leased mainly for raising crops. Originally, great areas of land in the South were held in large plantations and operated by slave labor. After emancipation that form of labor was superseded by some form of contract leasehold, by which the former slaves or wage laborers were given charge of small tracts of improved land, upon which they were to raise crops. The tracts thus leased included only the improved land of the old plantations, while the land retained by the plantation owners was mostly unimproved. This explains the exceptionally high per cent of improved land in farms of tenants and the correspondingly low per cent in those of owners and managers. The same general relation between the lands of owners and tenants exists in all parts of the country. A large proportion of tenant farms are but parts of larger farms once operated by their owners, who, with advancing years, lease the larger portion of their cultivable land to tenants, retaining the woodland and partially improved lands as their own farms.

In many sections of the South the small renter takes nothing but actually cultivated land. His rent, whether in money or kind, is generally, and over large areas invariably, per acre. Consequently it is to his interest to rent not one barren or idle acre, and the result is that large numbers of rented tracts are 100 per cent improved. Generally speaking, it is only the owners or renters of large bodies of land who have any considerable woodland or other land unimproved. Under the share system the interests of the landlord as well as the tenant demand that every acre rented be productive land. This probably explains the fact that the per cent of improved acreage is higher for share than for cash tenants.

Table XXV gives the average total and the average improved acreage per farm for each main class of tenure:

TABLE XXV.—*Average total and improved acreage in farms of negro, Indian, and Mongolian farmers classified by tenure: 1900.*

[1] Twelfth Census, Vol. V, page lxxxii.

The averages in the above table express in another way, and more precisely, the differences in the size of farms in different classes of tenure, already indicated by the comparison between the distribution of the number of farms and the distribution of farm acreage. In continental United States the average size of farms of owners is 77 acres, while that of tenants is only 45 acres; but the average numbers of acres improved are 33 and 31, respectively, or hardly more on farms of owners than on those of tenants. In the Northern South Atlantic states the tenant farms are exceptionally large and the owned farms exceptionally small, the result being that in this division the tenant's farm has not only a larger total acreage, but also a larger improved acreage, than the owner's. The exceptional character of this division as regards the tenure of farms is noted in other connections. It is due to several causes: This section of the country is the oldest seat of negro settlement in America; the slaves here were sifted, the least intelligent and the vicious being sold south and the house servant class retained; proximity to northern markets and a considerable city population make market gardening possible; all this has led the more intelligent to buy land and go into small farming with miscellaneous crops. On the other hand, tenant farming in this region only pays when entered into on a larger scale than that of the owned market garden, and at the same time there is no great staple crop like cotton to form the basis of a crop-lien system and lead to tenancy rather than ownership. The Western South Central states represent the other extreme, owners' farms being very much larger than those of tenants. It is probable that in this division the live stock farms, of which there are a considerable number operated by colored farmers, bring up the average for owners without greatly affecting that for tenants. Then, too, the greater ease of buying land in the West is a factor of importance. The exceptionally large size of the few managers' farms is noticeable in each division.

Value of farm property by tenure.—The per cent distribution, by tenure, of the total value of farm property is shown in the following table:

TABLE XXVI.—*Per cent distribution, by tenure, of the total value of property in farms of negro, Indian, and Mongolian farmers: 1900.*

DIVISION.	PER CENT OF THE TOTAL VALUE OF FARM PROPERTY IN FARMS OF—				
	Owners.	Managers.	Tenants.		
			All.	Cash.	Share.
Continental United States	32.9	1.8	65.3	32.6	32.7
South Atlantic division	28.8	2.0	69.2	32.8	36.4
Northern South Atlantic	47.2	4.7	48.1	15.1	33.0
Southern South Atlantic	23.7	1.3	75.0	37.7	37.3
South Central division	30.3	1.3	68.4	34.8	33.6
Eastern South Central	22.7	0.9	76.4	45.8	30.6
Western South Central	38.8	1.7	59.5	22.6	36.9

From this table it appears that owners' farms, which constitute 26.9 per cent of the total number of farms and comprise 38.3 per cent of the total acreage (Tables XXI and XXII), represent 32.9 per cent of the total value of farm property. This means that these farms are both larger and more valuable than the farms of tenants although the difference in value is not as great as the difference in size. Or, one might say, the tenant has a more valuable farm in proportion to its acreage than the owner, which would only be another way of repeating the fact that 57.8 per cent of the total acreage in owners' farms is unimproved land, while in tenants' farms the unimproved portion is only 31.2 per cent of the total. The Northern South Atlantic division, it will be remembered, is exceptional in showing a higher per cent of improved acreage for owners than for tenants, and in this division only does the owners' proportion of the total farm property exceed their proportion of the total acreage.

The per cent which the value of each class of farm property forms of the total farm value is shown in the following table:

TABLE XXVII.—*Per cent which the value of each specified class of farm property forms of the total value of farm property in farms of negro, Indian, and Mongolian farmers classified by tenure: 1900.*

DIVISION AND CLASS.	PER CENT OF THE TOTAL VALUE OF FARM PROPERTY.

Cash	64.8	12.4	3.7	19.1
Share	69.2	12.3	3.3	15.2

From this analysis it is evident that buildings, implements, and live stock represent larger percentages of the total value of property in owned farms than in tenant farms. This holds true for each of the minor

divisions of the South, as well as for continental United States. It follows that the percentage of the total farm value represented by land alone is smaller for owners than for tenants. The differences are shown in the above table. The owner's farm, however, is on the average a more valuable farm, so that the land, while constituting a smaller part of the total value of farm property, may nevertheless represent a greater value than the land on the tenant's farm. That this is to some extent the case is evident from the following table, which presents the average values of different classes of farm property:

TABLE XXVIII.—*Average values per farm of specified classes of property in farms of negro, Indian, and Mongolian farmers, classified by tenure: 1900.*

DIVISION AND CLASS.	AVERAGE VALUE OF FARM PROPERTY.				
	Total.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.

Cash	755	489	93	28	145
Share	660	457	81	22	100

In continental United States and in each of the minor southern divisions except the Northern South Atlantic, the owner's farm is more valuable than the tenant's, the difference being especially marked in the Western South Central states. But in the Northern South Atlantic division the total farm value and also the separate values of land, buildings, and live stock are higher for tenants than for owners. In the Southern South Atlantic states, while the value of land is higher on tenant farms, the values of the other items, as well as the total farm value, are somewhat lower. In each of the two South Central divisions, not only the total value of the farm, but also the value of each class of farm property, is higher on owners' farms than on those of tenants. The farms of managers show, in every division and for each class of property, a much higher value than those of either owners or tenants.

Value of farm products by tenure.—The following table gives the per cent which the value of products of 1899 not fed to live stock for each class of farms by tenure forms of the total value for all farms:

TABLE XXIX.—*Per cent distribution, by tenure, of the total value of the farm products not fed to live stock, for farms of negro, Indian, and Mongolian farmers: 1899.*

DIVISION.	PER CENT OF THE TOTAL VALUE COMPRISED IN FARMS OF—				
	Owners.	Managers.	Tenants.		
			All.	Cash.	Share.
Continental United States	24.1	0.7	75.2	38.1	37.1
South Atlantic division	24.0	0.7	75.3	35.7	39.6
Northern South Atlantic	49.3	1.9	48.8	14.3	34.5
Southern South Atlantic	20.0	0.6	79.4	39.0	40.4
South Central division	22.4	0.6	77.0	40.2	36.8
Eastern South Central	17.6	0.3	82.1	49.5	32.6
Western South Central	29.2	1.1	69.7	26.9	42.8

For continental United States the owners' proportion of the total value of products not fed to live stock (24.1 per cent) is not as large as their proportion of the total value of farm property (32.9 per cent), indicating that their farms are less productive in proportion to the value of the farm property than the farms of tenants. In the Northern South Atlantic, however, the difference is the other way, the tenants' farms representing a slightly larger proportion of the total value of products not fed than of the total value of farm property. The per cent which the value of products not fed forms of the total value of farm property is given for each class of tenure in the following table:

TABLE XXX.—*Per cent which the value of the products not fed to live stock forms of the value of farm property, for farms of negro, Indian, and Mongolian farmers, classified by tenure: 1899.*

DIVISION.	PER CENT WHICH THE VALUE OF THE PRODUCTS NOT FED TO LIVE STOCK FORMS OF THE VALUE OF FARM PROPERTY FOR FARMS OF—				
	Owners.	Managers.	Tenants.		
			All.	Cash.	Share.
Continental United States	31.9	17.6	50.2	50.9	49.4
South Atlantic division	40.3	17.6	52.8	52.8	52.9
Northern South Atlantic	31.6	12.1	30.7	28.7	31.6
Southern South Atlantic	45.1	23.2	56.8	55.4	58.1
South Central division	34.0	22.0	51.7	52.9	50.4
Eastern South Central	39.5	15.0	54.7	55.1	54.3
Western South Central	30.5	26.1	47.3	48.1	46.8

It appears from this table that the products raised on farms of tenants are equivalent, in value, to one-half (50.2 per cent) of the value of such farms; on farms of owners the products are equivalent to less than one-third (31.9 per cent) of the farm value. These percentages confirm the inference already made with

reference to comparative productiveness of tenants' and owners' farms, as measured by the ratio of value of products to value of property. The greatest difference between owner and tenant is in the general methods of farming; the owner seeks more to preserve the native powers of the soil, and consequently does not raise as large crops by wasteful and forcing methods; his crops are more diversified, and he cultivates more articles for home consumption; more of his capital is put into permanent improvements and less into seed, fertilizers, and hired labor.

The average values per farm and per acre of products of 1899 not fed to live stock are presented in the following table:

TABLE XXXI.—*Average values, per farm and per acre, of the products not fed to live stock for farms of negro, Indian, and Mongolian farmers: 1899.*

DIVISION.	AVERAGE VALUE PER FARM FOR FARMS OF—				
	Owners.	Managers.	Tenants.		
			All.	Cash.	Share.
Continental United States	$278	$945	$320	$331	$311
South Atlantic division	223	598	295	281	308
Northern South Atlantic	171	547	246	200	271
Southern South Atlantic	252	630	300	288	313
South Central division	330	1,449	328	350	308
Eastern South Central	307	694	329	345	307
Western South Central	351	2,267	328	363	309

DIVISION.	AVERAGE VALUE PER ACRE FOR FARMS OF—				
	Owners.	Managers.	Tenants.		
			All.	Cash.	Share.
Continental United States	$3.59	$3.40	$7.09	$6.87	$7.32
South Atlantic division	4.29	2.89	5.43	5.04	5.84
Northern South Atlantic	4.49	4.00	3.53	3.36	3.60
Southern South Atlantic	4.21	2.51	5.72	5.18	6.36
South Central division	3.75	3.97	8.31	8.07	8.59
Eastern South Central	4.00	3.72	8.21	7.79	8.93
Western South Central	3.56	4.06	8.49	8.90	8.25

The average production per farm is higher for tenants than for owners in each minor geographic division except the Western South Central, in which, it will be remembered, the farms of owners represent a much greater average value of property than the farms of tenants (Table XXVIII). The average value of products per farm for share tenants is higher than that for cash tenants in the two South Atlantic divisions, but lower in the two South Central divisions. The averages per acre are affected to a considerable extent by the proportion of acreage improved. A farm in which most of the land is improved will naturally produce more per acre than one in which the proportion of improved land is smaller. It is not surprising, then, to find that in the South Central divisions, where about 75 per cent of the tenants' acreage is improved and only about 45 per cent of the owners' (Table XXIV), the average value of products per acre is more than twice as high for tenants as for owners. In the Southern South Atlantic division a similar, though less marked, contrast exists, but in the Northern South Atlantic division both the per cent of improved acreage and the average value of products per acre are lower for tenants than for owners.

General conclusions.—Several things are noticeable in regard to tenure: First, the percentage of tenancy in most of the Southern states and especially in Alabama, Georgia, Louisiana, and Mississippi is high; second, those states with a relatively large percentage of owners—Texas, Virginia, Delaware, District of Columbia, Florida, Kentucky, Maryland, and West Virginia—have in nearly all cases fewer cash tenants, or renters, than share tenants, or metayers, showing that it is as easy to pass directly from share tenancy to ownership as to stop at the intermediate stage. The District of Columbia and Florida are exceptions to this rule because of market gardening of the District and the peculiar crops of Florida. On the other hand, where the percentage of ownership is small, the tendency often is for the cash renters to outnumber the metayers and thus secure the differential advantages by assuming the greater risk. This is shown by the figures for Alabama, Mississippi, and South Carolina, where the renters exceed the metayers, and the same tendency is manifest, though less marked, in Georgia, Louisiana, Arkansas, and Tennessee. North Carolina stands between the owning and tenant states.

In all these divisions there are certain points brought out by comparing the renters and metayers. The metayers usually excel in the value per acre of their produce, not counting that fed to live stock. This means that the metayer's chief object is to get a large crop, and that this crop often represents a forcing of the natural productiveness of the soil and a neglect of stock raising. Consequently, as we should expect, the renters in most cases have more stock. In the centers of negro population the renter also has better tools to work with. On the other hand, the metayer is apt to have a better home. At first sight this seems illogical, but it most probably means that the strain of a rising social class, as the renters are, falls often on home comforts. They economize here, living in the old one-room cabin, and eating and dressing meagerly until they can buy land. The metayer, on the other hand, may have his home repaired at the owner's expense, or, having no intention of buying land, may not deny himself many available comforts. Certain differences, too, are manifest between the East and West—i. e., between the North and South Atlantic states on the one hand and the North and South Central states on the other. In the West the land of the renter is the more valuable. In the East that of the metayers is the more valuable, although this is not wholly true in the North Atlantic states. At any rate, taking into account all the farm property, the renter is noticeably the richer in the West, and the metayer, in the North. Both these

phenomena are, of course, explained by the richer and more abundant land of the Mississippi valley.

THE RELATIVE IMPORTANCE OF THE NEGRO IN AGRICULTURE.

An attempt has been made in the foregoing study to treat the negro farmers as a group without comparing them directly with the whites. This is necessary if one would gain an intelligent picture of the development of the freedmen's sons and not be misled by inapt comparison. Nevertheless the great and patent fact is that this group of negroes is not developing by itself, but is surrounded by a large and rich nation of whites. What are the relations of the black to the environing white group? Their relations are of three kinds: They stand as laborer to employer, as tenant to landlord, and as coproducers of the wealth of the land. The first of these three relations has been touched on but casually in this discussion; the second has been treated at considerable length. Let us now consider the third.

Proportion of the total farm acreage and total farm values in farms operated by negroes. Some light upon this question may be derived from the following table showing what percentages of the total number of farms, total farm acreage and farm values, and total expenditures for labor and fertilizers, are comprised in farms operated by negroes.

TABLE XXXII.—PER CENT OF THE TOTAL NUMBER OF ALL FARMS, TOTAL ACREAGE, AND TOTAL SPECIFIED VALUES AND EXPENDITURES COMPRISED IN FARMS OPERATED BY NEGROES: 1900.

PER CENT OF THE TOTAL FOR ALL FARMS COMPRISED IN FARMS OPERATED BY NEGROES.

DIVISION AND STATE OR TERRITORY.	Number of farms.	Acreage.	Improved acreage.	Value of farm property.					Value of products 1899.	Value of products of 1899 not fed to live stock.	Expenditure for labor: 1899.	Expenditure for fertilizers: 1899.
				Total.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.				
Continental United States	13.0	4.6	5.6	2.4	2.7	2.2	2.8	3.3	5.4	6.1	2.5	10.5
South Atlantic division	29.9	14.9	19.3	11.2	11.9	8.7	11.1	12.4	18.8	19.6	9.9	20.4

North Central division	0.6	0.2	0.3	0.2	0.3	0.2	0.3	0.4	0.2	0.2	0.2	0.2
Western division	0.2	0.1	0.1	0.1	1.1	0.7	1.5	1.2	0.1	0.1	0.1	0.1

The negro farmer conducts 13 per cent or about one-eighth of the farms in continental United States, and controls 4.6 per cent of the total farm acreage, 5.6 per cent of the improved acreage, and 2.4 per cent of the farm property. He raises 5.4 per cent of the total farm products measured by value and 6.1 per cent of the farm products not fed to live stock. These figures are small, but that is because the country is so large and rich.

In the North Atlantic division the negro farmer is a negligible quantity, cultivating only three-tenths of 1 per cent of all the farms in that division. In the North Central states he is a somewhat larger figure, but holds only six-tenths of 1 per cent of the farms. In the Western states the proportion falls to one-tenth of 1 per cent. If, however, we confine our comparison to the South we find that the negro conducts considerably more than a fourth of the farms, a little more than a tenth of the total acreage, more than a sixth of the improved acreage, and about a ninth of the farm property; and that he raises more than a sixth of the gross products, according to value, and almost a fifth of the products not fed to live stock. These statistics, of course, take no account of the negro's productivity as a farm laborer, but only as a farmer. It is noticeable that while the contribution of the negro farmer to the agricultural production of the South comes short of his proportion of the total number of farms, it fully equals his proportion of the improved acreage, and exceeds his proportion of the total farm acreage and farm property.

In the South Atlantic division negroes hold a little

more than two-sevenths of the farms, over one-seventh of the acreage, and one-ninth of the total farm property, and raise one-fifth of the farm products measured by value. They hire one-tenth of the farm labor measured in wages, and use over one-fifth of the fertilizers. In the South Central division they hold a smaller proportion of the total number of farms and of the total acreage, but their proportion of the total farm property and farm products is about the same as in the other division. They spend as much relatively for labor but less for fertilizers.

If we consider the figures by states we may get additional light. Over one-half the farms in Louisiana, Mississippi, and South Carolina are conducted by negroes; between one-third and one-half in Alabama and Georgia; and between one-fourth and one-third in Virginia, Arkansas, and Florida. Mississippi has nearly one-third of its total farm acreage under negro farmers, and Alabama, Georgia, Louisiana, and South Carolina have from one-fifth to one-third of their acreage. Of the total value of farm property negroes control two-fifths in Mississippi, more than one-fourth in Alabama and South Carolina, and about one-fifth in Louisiana and Georgia. Of farm products measured by value negroes raise more than one-half in Mississippi, two-fifths in South Carolina, and from one-fourth to one-third in Alabama, Georgia, Louisiana, and Arkansas. It is evident, then, that in a large section of the South, and notably in the Gulf states, agricultural industry is dependent to a very large degree upon the cooperation of the negro farmer, leaving out of account the services of the negro farm laborer.

Proportion of classified farms operated by negroes. The following table shows the proportion of farms operated by negroes in each class of tenure:

TABLE XXXIII.—*Per cent which farms operated by negroes form of the total number of farms in each class of tenure: 1900.*

CLASS OF FARMS.	PER CENT OPERATED BY NEGROES.					
	Continental United States.	North Atlantic division.	South Atlantic division.	North Central division.	South Central division.	Western division.
All farms	13.0	0.3	29.9	0.6	26.8	0.2
Farms of—						
Owners	5.0	0.2	14.7	0.4	10.8	0.1
Part owners	6.7	0.4	30.4	0.7	16.0	0.1
Owners and tenants	2.8	0.1	8.0	0.5	6.4	0.1
Managers	2.9	0.5	10.6	0.6	6.2	0.1
Cash tenants	36.3	0.5	58.2	0.8	59.8	0.1
Share tenants	22.3	0.3	40.4	0.9	34.2	0.2

As would be expected, the proportion of negroes is largest among tenant farmers; and it is interesting to note that it is larger among cash tenants than among share tenants. For each class of tenure the per cent of farms operated by negroes is naturally highest in the southern divisions. For cash tenants it is slightly higher in the South Central states than in the South Atlantic, but for all other classes the South Atlantic shows the higher proportion—a natural result of the fact that negro farmers are more numerous in that division in proportion to the white.

The position of the negro farmer will be better understood if we separate the farms according to size. The following table shows the percentage of the farms of specified area cultivated by negroes:

TABLE XXXIV.—*Per cent which the farms operated by negroes form of the total number in each group of farms classified by area: 1900.*

CLASS OF FARMS.	PER CENT OPERATED BY NEGROES.					
	Continental United States.	North Atlantic division.	South Atlantic division.	North Central division.	South Central division.	Western division.
All farms	13.0	0.3	29.9	0.6	26.8	0.2
Under 3 acres	10.6	0.6	46.0	1.3	20.2	0.2
3 and under 10	22.4	0.8	50.2	2.0	37.8	0.2
10 and under 20	29.4	0.6	46.6	2.1	44.6	0.1
20 and under 50	27.3	0.4	45.6	1.3	43.6	0.1
50 and under 100	9.8	0.2	25.0	0.4	21.0	0.1
100 and under 175	4.7	0.1	15.8	0.2	10.7	0.2
175 and under 260	3.4	0.1	11.1	0.2	7.7	0.1
260 and under 500	2.3	0.1	7.7	0.1	5.8	0.1
500 and under 1,000	2.0	0.1	6.1	0.1	3.6	0.1
1,000 and over	1.1	.....	3.9	0.1	1.4	0.1

Comparing the above percentages for the United States as a whole we may make three classes of farms: Of the large farms, containing 100 acres and above, the negro cultivates only a small proportion—from 1 to 5 per cent. Of the small market gardens and other farms under 3 acres, and of the middle-sized farms of from 50 to 100 acres, he cultivates about 10 per cent, which is less than his proper proportion. On the other hand, he cultivates a relatively large proportion—between 22 and 30 per cent—of the farms from 3 to 50 acres in extent.

In the South Atlantic states the negro cultivates nearly one-half of all farms under 50 acres; one-fourth of those from 50 to 100 acres, and a diminishing proportion of the farms above that size. The negro farmers constitute 30 per cent of all farmers in this division, and therefore have more than their proportion of the farms under 50 acres, but less than their proportion of the farms over 50 acres.

In the South Central states a little more than one-fourth of all farms are in the hands of negroes. The proportion is smaller—about one-fifth—for the garden-farm class, under 3 acres, and for the two-mule farms of 50 to 100 acres; but it is very much larger for farms between 3 and 50 acres. As in the South Atlantic division, the percentages diminish rapidly as the sizes of farms increase above 50 acres.

For each class of farms the per cent cultivated by negroes is higher in the South Atlantic states than in the South Central; but the difference is most marked for farms under 3 acres, of which the per cent cultivated

by negroes is 46 in the former division and only 20.2 in the latter.

Another comparison may be made by ascertaining what proportion of the farms in each class as determined by the principal source of income are cultivated by negroes. The following table gives the percentages:

TABLE XXXV.—*Per cent which the farms operated by negroes form of the total number in each group of farms classified by principal source of income: 1900.*

CLASS OF FARMS.	PER CENT OPERATED BY NEGROES.					
	Continental United States.	North Atlantic division.	South Atlantic division.	North Central division.	South Central division.	Western division.
All farms	13.0	0.3	29.9	0.6	26.8	0.2
Farms reporting as principal source of income—						
Cotton	49.1	.....	49.9	5.6	48.9	.....
Rice	37.3	.....	74.6	.....	14.1	.....
Tobacco	18.3	0.2	30.5	1.2	11.3	.....
Sugar	14.8	.....	18.7	1.3	22.0	.....
Vegetables	10.0	0.7	31.7	1.3	22.8	0.3
Miscellaneous products	8.8	0.2	22.6	0.9	0.1	0.1
Hay and grain	3.9	0.3	17.5	0.5	9.3	0.1
Fruits	2.7	0.3	11.5	1.2	7.0	0.1
Live stock	2.0	0.3	9.6	0.4	5.0	0.2
Dairy produce	1.4	0.1	8.1	0.3	10.3	0.2
Flowers and plants	0.4	0.3	1.6	.....	0.7	0.6
Nursery products	0.4	0.6	0.6	.....	0.7	0.4

From this table it appears that the negro cultivates one-half of all the cotton farms, more than one-third of all the rice farms, rather less than one-fifth—or, to be more exact, two-elevenths—of the tobacco farms, and one-seventh of the sugar farms. Of all these farms he cultivates more than his due proportion, the negroes constituting, it will be remembered, hardly more than one-eighth of all the farmers in the United States. He also cultivates a considerable proportion of the miscellaneous and vegetable farms. In none of the remaining classes does his proportion come up to 4 per cent of the totals for the United States; but in the Southern states farms operated by negroes comprise a considerable percentage also of the hay and grain, fruit, live stock, and dairy farms.

In the North Atlantic states the farms of negroes in no instance form 1 per cent of all farms for any principal crop. They form the largest proportion in vegetable (0.7 per cent) and nursery farms (0.6 per cent). In the North Central states, 5.6 per cent of the few cotton farms were cultivated by negroes, and a little over 1 per cent of the vegetable (1.3 per cent), fruit (1.2 per cent), tobacco (1.2 per cent), and sugar farms (1.3 per cent). In the Western states the highest per cent, 0.6, is that shown for farms reporting flowers and plants as the principal source of income.

If we consider the farms of the country with reference to income, classifying them according to the value of products not fed to live stock, we find, as would be expected, that the negroes hold a very small proportion of the farms which yield the larger incomes, and a rather large proportion of the less valuable farms. The percentages are as shown in the following table:

TABLE XXXVI.—*Per cent which the farms operated by negroes form of the total number in each group of farms classified by gross income, or value of products not fed to live stock: 1900.*

CLASS OF FARMS.	PER CENT OPERATED BY NEGROES.					
	Continental United States.	North Atlantic division.	South Atlantic division.	North Central division.	South Central division.	Western division.
All farms	13.0	0.3	29.9	0.6	26.8	0.2
Farms reporting a gross income of—						
$0	19.4	0.5	38.3	1.0	35.9	0.2
$1 and under $50	30.3	0.7	55.3	2.4	37.0	0.3
$50 and under $100	23.9	0.8	45.8	2.1	30.8	0.2
$100 and under $250	19.9	0.5	34.8	1.3	29.8	0.2
$250 and under $500	15.9	0.2	28.4	0.6	28.9	0.1
$500 and under $1,000	6.9	0.2	16.9	0.3	20.9	0.1
$1,000 and under $2,500	1.7	0.1	6.5	0.1	10.3	0.1
$2,500 and over	0.5	0.1	2.1	0.1	3.3	(1)

[1] Less than one-tenth of 1 per cent.

It appears that negroes hold one-fifth of the farms reporting no income, somewhat less than one-third of those reporting an income under $50, almost one-fourth of those reporting from $50 to $100, and one-fifth of those reporting from $100 to $250. The proportion for farms returned as having no income is unduly large because, as explained in the census report on agriculture, "some enumerators found great difficulty in securing what they deemed accurate crop reports from the negro tenants on large plantations. They obtained the names of the tenants and the number of acres operated by each, and then secured from the owner a statement of the aggregate crops raised by the several tenants, reporting all upon the schedule of the owner. They did not attempt to distribute the crops among the tenants, hence the schedules for the farms of these tenants show no crops and their farms appear in this report as farms without income."

Proportion of farm animals and crops on farms operated by negroes.—The proportion of the total number of farm animals found on farms of negroes is shown in the following table:

TABLE XXXVII.—*Per cent which the number of specified domestic animals reported on farms operated by negroes forms of the total number reported on all farms.*

KIND OF DOMESTIC ANIMALS.	PER CENT ON FARMS OPERATED BY NEGROES.					
	Continental United States.	North Atlantic division.	South Atlantic division.	North Central division.	South Central division.	Western division.
Neat cattle	2.2	0.1	9.7	0.1	5.4	0.1
Dairy cows	3.2	0.1	12.1	0.2	12.6	0.1
Other cows	1.3	0.1	7.1	0.1	2.1	0.1
All other neat cattle	1.9	0.1	9.1	0.1	4.9	0.1
Horses	3.2	0.2	12.7	0.3	13.8	0.1
Mules	15.4	0.3	26.2	0.8	19.6	0.1
Asses and burros	1.5	0.1	8.0	0.5	2.8	0.1
Sheep and lambs	0.2	0.1	0.9	0.1	1.1	(1)
Swine	4.7	0.2	16.5	0.2	15.0	0.1
Goats	3.4	0.2	10.5	0.6	4.3	(1)

[1] Less than one-tenth of 1 per cent.

The highest percentages in this table are those for the mule. Of the total number of farm mules in the United States about one-sixth, or more accurately two-thirteenths, are found on farms of negroes; in the South Atlantic states the proportion is one-fourth and in the South Central one-fifth. The table indicates that the pig, the dairy cow, and the horse are the animals ranking next to the mule in the extent to which they are found on farms of negroes. A comparison with the percentages given in Table XXXII, shows that in neither southern division is the negro's proportion of the total number of any kind of domestic animal equal to his proportion of the total number of farms; but compared with his total farm acreage and farm wealth, he has more mules, swine, dairy cows, and horses than the white farmer in the South Central states, and more mules and swine in the South Atlantic. Reference has already been made to the probability that in the census returns many mules and horses used on farms of negro tenants were credited to the farm of the landlord who was the owner of these animals.[1]

The negro farmers produce almost two-fifths of all the cotton raised in continental United States, more than one-fifth of the sweet potatoes, and about one-tenth of the tobacco and the rice. These are crops which are mainly or entirely confined to the South, the two southern divisions producing all the rice grown in continental United States and all the cotton, with the exception of a comparatively small quantity grown in Missouri and Kansas. Of the sweet potatoes, 87.2 per cent are produced in the southern divisions, and of the tobacco, 84.2 per cent. Accordingly, for these crops the proportion of the total production of continental United States grown on farms operated by negroes corresponds closely to the proportion of the production of the Southern states grown on their farms.

Of the other crops the proportion grown by negroes is very small, being less than 1 per cent for all except corn, for which their proportion is 3.7 per cent. If the comparison be restricted to the Southern states the percentages are naturally somewhat larger, the negro farmers raising 14.7 per cent of all the corn grown in the two southern divisions and 8.6 per cent of all the potatoes.

The following table shows the proportion of the principal crops grown on farms of negroes:

TABLE XXXVIII.—*Per cent of the total quantity of the specified crops raised on farms operated by negroes in 1899.*

CROP.	PER CENT OF TOTAL CROP RAISED ON FARMS OPERATED BY NEGROES.			
	Continental United States.	South Atlantic and South Central divisions.	South Atlantic division.	South Central division.
Corn	3.7	14.7	17.0	13.9
Wheat	0.6	2.9	5.1	1.8
Oats	0.4	4.3	9.5	2.7
Barley	(1)	1.6	1.3	1.7
Rye	0.2	2.4	2.8	1.5
Buckwheat	0.2	0.9	0.9	0.4
Rice	9.3	9.3	22.5	4.3
Hay[2]	0.5	3.7	5.1	3.1
Potatoes	0.9	8.6	9.0	9.1
Sweet potatoes	21.1	24.0	23.3	24.9
Cotton	38.9	39.0	38.6	39.2
Tobacco	10.2	13.1	20.4	7.1

[1] Less than one-tenth of 1 per cent.
[2] Hay and forage exclusive of cornstalks.

Comparison of averages for white and for negro farmers. A comparison between the negro and white farmer may be presented by means of averages. The following table gives the average size and value of farms and the average value of products and of expenditures for labor and fertilizers:

TABLE XXXIX.—AVERAGE ACREAGE PER FARM FOR FARMS OF WHITE AND OF NEGRO FARMERS, AVERAGE VALUE OF FARM PROPERTY AND FARM PRODUCTS, AND AVERAGE EXPENDITURES FOR LABOR AND FERTILIZERS: 1900.

AVERAGE.	CONTINENTAL UNITED STATES.		NORTH ATLANTIC DIVISION.		SOUTH ATLANTIC DIVISION.		NORTH CENTRAL DIVISION.		SOUTH CENTRAL DIVISION.		WESTERN DIVISION.	
	Farms of white farmers.	Farms of negro farmers.	Farms of white farmers.	Farms of negro farmers.	Farms of white farmers.	Farms of negro farmers.	Farms of white farmers.	Farms of negro farmers.	Farms of white farmers.	Farms of negro farmers.	Farms of white farmers.	Farms of negro farmers.
Average number of acres per farm:												
Total acreage	160.3	51.2	96.7	47.9	131.7	54.1	144.6	64.2	194.6	48.9	395.8	225.5
Improved acreage	78.5	31.3	57.5	31.3	55.3	30.8	101.7	46.2	54.5	31.2	114.5	61.9
Average value of farm property per farm:												
Total	$4,016	$669	$4,361	$2,712	$1,917	$566	$5,263	$2,008	$2,065	$690	$7,221	$3,177
Land and improvements (except buildings)	2,567	434	2,221	1,513	1,178	369	3,598	1,463	1,208	443	4,746	2,133
Buildings	701	96	1,440	832	416	93	777	239	305	91	708	329
Implements and machinery	149	25	226	117	70	20	167	59	95	27	222	107
Live stock	599	114	474	250	253	84	721	247	457	129	1,545	548
Average value of products per farm:												
Total	900	342	985	512	561	304	1,080	444	599	364	1,415	614
Products not fed to live stock	709	308	731	388	481	275	820	346	510	328	1,214	509
Average value per acre of products not fed to live stock	4.41	6.01	7.56	8.10	3.66	5.08	5.67	5.39	2.62	6.71	3.06	2.26
Average expenditures per farm:												
For labor	71	12	105	49	13	37	66	20	37	11	236	88
For fertilizers	10	8	23	16	16	5	3	1	5	2	4	4

For all values in the above table, except the value per acre of products not fed to live stock, the contrast between the two races is much more marked in the United States, as a whole, than it is in the two southern divisions, simply because the inclusion of the northern and western divisions increases very materially—in many cases more than doubling—the averages for white

[1] See page 515.

farmers, without greatly affecting those for negro farmers, comparatively few of whom are found in those divisions. For each race the average values are in most instances somewhat higher in the South Central division than in the South Atlantic. Buildings form an exception to this statement, their average value being considerably lower in the South Central than in the South Atlantic for white farmers, and slightly lower for negro farmers. This may be due in some measure to climatic differences between the two sections.

The negro is preeminently the small farmer, cultivating 50 acres while the white farmer has 160. The contrast is greatest in the South Central states, where the inclusion of the large cattle ranches in the state of Texas increases the average acreage for white farmers without perceptibly affecting that for negroes. In some of the Northern and Western states the contrast in size between farms of negroes and of whites is not very great; and in a few instances—Vermont, the two Dakotas, and New Mexico—the negro operates a larger average acreage than the white man.[1] But there are only a handful of negro farmers in any of these states.

In most of the Southern states the farms of negroes have a much larger proportion of improved acreage than those of the whites, and accordingly the difference between the two races, indicated by the averages in Table XXXIX, is less marked for the improved than for the total acreage. This perhaps is a natural result of the fact that the negro farms are small and that three-fourths of them are rented farms, while the proportion of rented farms for white farmers is less than one-third. The difference in the per cent of improved acreage is shown for the main geographic divisions and the Southern states in the following table:

TABLE XL.—*Per cent of improved acreage in farms of white and of negro farmers: 1900.*

DIVISION AND STATE OR TERRITORY.	Farms of white farmers.	Farms of negro farmers.
Continental United States	49.0	61.1
South Atlantic division	42.0	57.0
Delaware	71.0	65.8
Maryland	68.3	63.8
District of Columbia	69.7	75.3

[1] See Table LXIII.

In the average value of farms, as shown in Table XXXIX, the contrast between the two races is more marked than in the average acreage, the white man's farm being six times as valuable as the negro's in the United States as a whole, and seldom less than twice as valuable in any individual state. In this comparison the negro farmer makes a nearer approach to equality with the white farmer in the North and West than in the South, the value of the white man's farm being about three and one-half times that of the negro's in the South Atlantic division, three times in the South Central, two and one-half times in the North Central, two and one-third times in the Western, and one and three-fifth times in the North Atlantic. But measured by the value of products the difference between the negro's farm and the white man's is less marked in the South than in the North, the average value per farm of products not fed to live stock being rather more than one and one-half times as great for white as for negro farmers in each of the two southern divisions, but almost twice as great in the North Atlantic division and more than twice as great in the North Central and in the Western divisions.

The only item in Table XXXIX which shows a higher average for negroes than for whites is the value per acre of products not fed to live stock. This exception is doubtless due in large measure to the fact that negroes have, as we have seen, much smaller farms with higher percentages of improved acreage. But even if the average be computed on the basis of the improved acreage alone, it is still somewhat larger for the negro than for the white farmer, notwithstanding the fact that this computation gives the white farmer the advantage resulting from crediting the improved acreage with the products of the unimproved. He gains more by this than the negro does, because his unimproved acreage is relatively greater. The results of the two computations are presented in the following table:

TABLE XLI.—*Average value per acre of products not fed to live stock on farms operated by white and by negro farmers: 1900.*

DIVISION.	AVERAGE FOR TOTAL ACREAGE.		AVERAGE FOR IMPROVED ACREAGE.	
	Farms of white farmers.	Farms of negro farmers.	Farms of white farmers.	Farms of negro farmers.
South Atlantic	$3.66	$5.08	$8.71	$8.91
South Central	2.62	6.71	9.36	10.52

Ratio of value of products to value of farm property.—In proportion to their size, then, the farms of negroes are more productive than those of white men. They are also more productive in proportion to their value, as is shown by the following table giving for white and for negro farmers the percentage which the value of products not fed to live stock forms of the total value of farm property:

TABLE XLII.—*Per cent which the value of products not fed to live stock forms of the total value of farm property on farms of white and of negro farmers in each geographic division: 1900.*

DIVISION.	Farms of white farmers.	Farms of negro farmers.
Continental United States	17.7	46.0
North Atlantic	16.8	14.3
South Atlantic	25.1	48.6
North Central	15.6	17.2
South Central	24.7	47.5
Western	16.8	16.3

The total value of products raised on farms of negroes in continental United States is equivalent to 46 per cent of the total value of the farm property; the corresponding per cent for white farmers is 17.7.

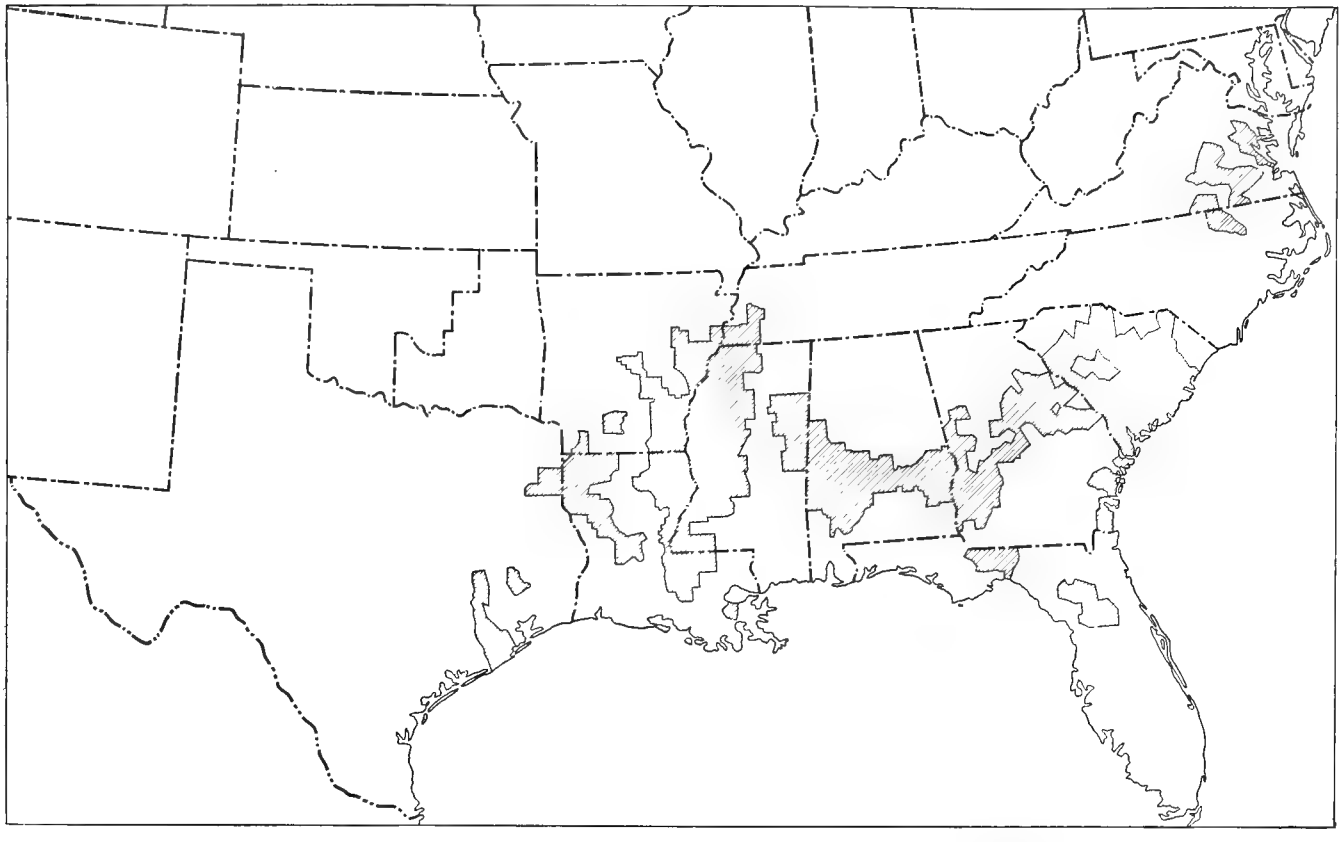
If we restrict the comparison to the southern divisions the difference is not so marked; for negro farmers the value of products not fed to live stock approaches one-half the value of their farm property, while for white farmers it is only about one-fourth. The following table presents the percentages for each of the Southern states:

TABLE XLIII.—*Per cent which the value of products not fed to live stock forms of the total value of farm property on farms of white and of negro farmers in each Southern state: 1900.*

DIVISION AND STATE OR TERRITORY.	Farms of white farmers.	Farms of negro farmers.	DIVISION AND STATE OR TERRITORY.	Farms of white farmers.	Farms of negro farmers.
South Atlantic division	25.1	48.6	South Central division	24.7	47.5
Northern South Atlantic	19.1	30.2	Eastern South Central	26.8	50.9
Delaware	18.1	19.6	Kentucky	21.5	27.7
Maryland	17.0	19.9	Tennessee	24.8	36.2
District of Columbia	7.4	5.7	Alabama	41.0	57.1
Virginia	21.7	35.0	Mississippi	36.7	54.9
West Virginia	17.9	20.1	Western South Central	23.2	43.2
Southern South Atlantic	33.5	53.6	Louisiana	29.2	50.5
North Carolina	32.0	47.1	Arkansas	34.0	46.9
South Carolina	34.6	56.0	Indian Territory	25.8	28.8
Georgia	36.2	55.8	Oklahoma	20.3	20.9
Florida	27.4	49.3	Texas	20.7	38.3

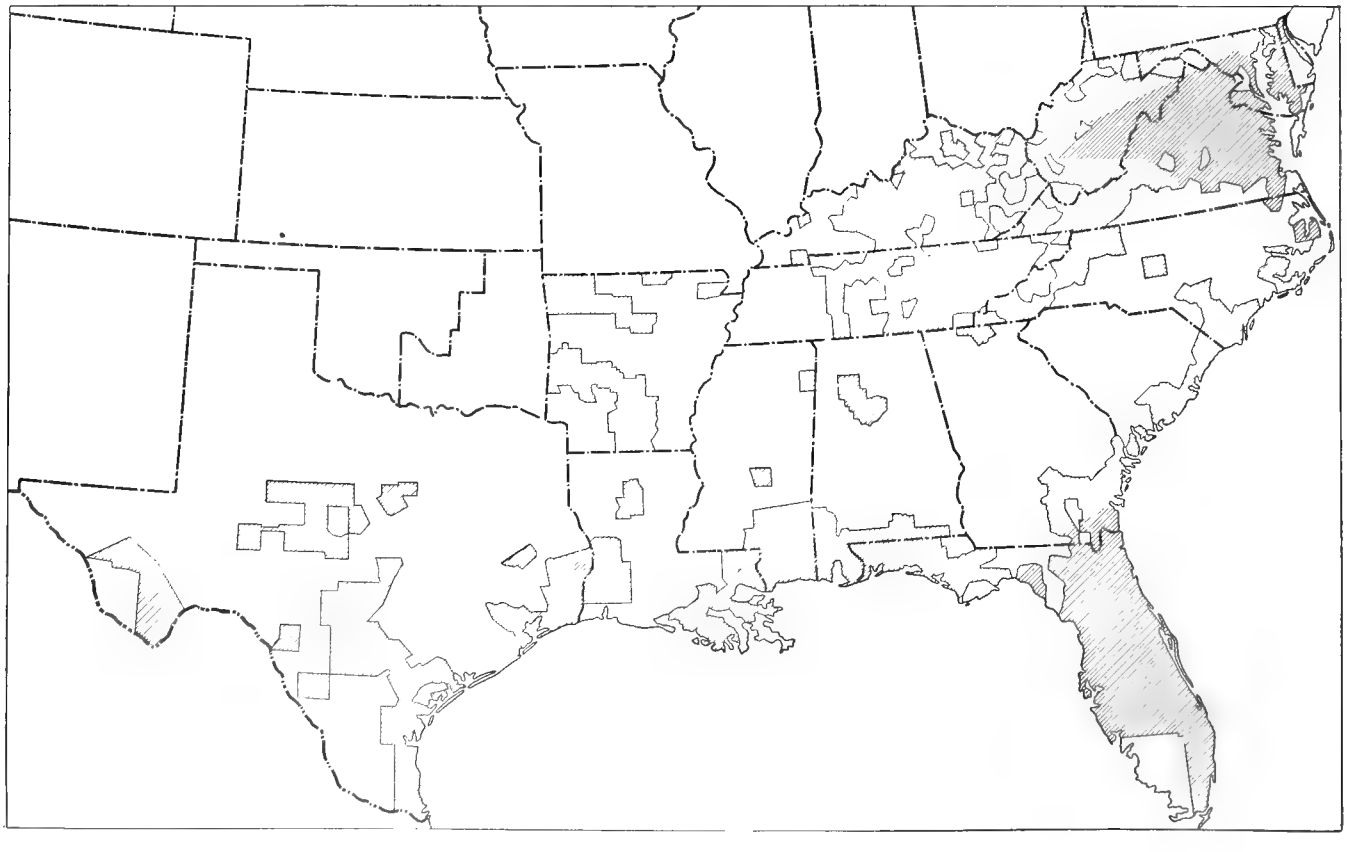
It will be found that the contrast between the two percentages is greatest in the states having a large negro population. They are most of them cotton growing states, in which the great majority of negro farmers are tenants, cultivating land owned by white landlords.

These percentages, however, are not to be accepted as a criterion of the relative profitableness of farming as carried on by the two races. It is true that the average values of products per acre presented in Table XXXIX indicate that a given area of agricultural land located in the black belt of the South and farmed by negro tenants yields a greater value than an equal area cultivated by white farmers outside the black belt. This larger return to the negro farmer does not necessarily prove that he is a superior farmer to the white cultivator, any more than the larger return of the negro tenant is evidence of his greater prosperity as compared with the negro owner. It shows rather different conditions of farming. First there come considerations as to the form in which the farmer gets his returns; some get it in marketable products, others in live stock, others in improved homes and social advantages. The white farmer gets fewer products, but more live stock, a better house and a more advantageously situated home; the negro farmer must raise goods easily sold, so as to turn over his small capital quickly. For these returns the white farmer invests principally his cash capital, land, and experience; the negro invests his labor, skill, and his capital as represented in his mule and seed. Thus each is investing his resources for such returns as they will bring and such as he values.



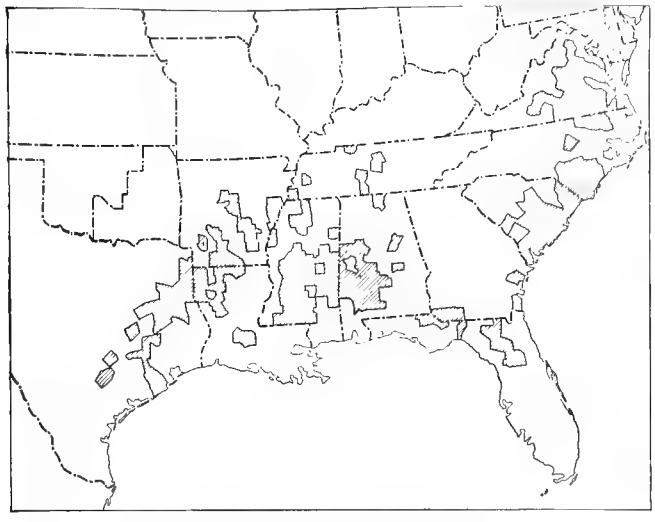
FARM OWNERSHIP AND THE FARMING BLACK BELT.

In another portion of this report[1] what is commonly termed the black belt has been described in the text and its geographic position defined and illustrated by means of maps. In this connection it will be appropriate to consider what may be termed the farming black belt, consisting of those county areas in which negro farmers constitute one-half or more than one-half of all farmers. This will differ from the population black belt principally in leaving out of account the influence of the urban population. Map 49 shows the farming black belt. With a view to determining what influence, if any, the massing of negroes may have upon the form of farm tenure, two other maps have been prepared, Map 50 showing, for the Southern states exclusive of Oklahoma and Indian Territory, those counties in which the farms owned by negroes form 50 per cent or more of all farms operated by negroes, and Map 51 showing for the same states those counties having 300 or more farms owned by negroes.



Considering these maps together, it will be noticed that the largest proportion of ownership is often outside the black belt while the larger number of owners is usually in that region. In Alabama, e. g., the farming black belt extends across the south central half of the state; here the proportion of negro to all farmers rises to 75 per cent or more in eleven counties. Here the relative number of owners among the black farmers is usually smaller than elsewhere in the state. The absolute number of negro owners is, however, largest in this belt, so that if we mark the counties with 300 or more negro owners we find that these counties are nearly all in the farming black belt. Mere numbers, of course, will not explain land ownership or the lack of it. In many counties where the proportion of ownership among negro farmers is large, the figures are of little significance as the number of negroes in those counties is very small. The real question is, what are the surrounding influences of the black farmer. In six of the black belt counties where the negro population is densest the illiteracy of the adult males reaches 66 per cent or

[1] Section on "Negroes."



MAP 49.—SOUTHERN COUNTIES IN WHICH THE FARMS OPERATED BY NEGROES IN 1900 CONSTITUTED AT LEAST 50 PER CENT OF ALL FARMS.

MAP 50.—SOUTHERN COUNTIES IN WHICH FARMS OWNED AND OPERATED BY NEGROES IN 1900 CONSTITUTED AT LEAST 50 PER CENT OF ALL FARMS OPERATED BY NEGROES.

MAP 51.—*Southern counties in which there were at least 300 farms owned and operated by negroes in 1900.*

more, and the past and present economic conditions are not favorable to the laborers. In other counties, both within and outside the black belt, where the number of negro owners is large, the direct influence of educational institutions is manifest, as in Talladega, Madison, Elmore, Macon, and Lowndes counties.

The farming black belt of Arkansas centers in the southeastern part, along the Mississippi. The largest proportion of owners is in the southwest, overlapping the black belt, while the counties having the largest absolute number of owners include the black belt counties, with a few exceptions, and overlap toward the southwest. This state really exhibits two black belts—one formed in slavery days, where the precedents among both employer and employed are unfavorable to land ownership; another representing western expansion to new lands, where the number and proportion of ownership is high.

In Delaware and Maryland the proportion of colored owners of farms is in general much greater than in the states having a larger negro population probably because of better education and greater opportunities.

In Florida the percentage of ownership among negro farmers is comparatively high throughout the state. The negro farmers are relatively most numerous, outnumbering the white, in the region around Tallahassee and between Ocala and Gainesville. Of the 5 counties included in this area 3 are also in the area having more than 50 per cent of owners.

The farming black belt of Georgia has two divisions, the main part extending in a southwesterly direction through the center of the state and a smaller part extending along the sea islands in the southeast. In the first region the proportion of owners is smaller than elsewhere in the state; in the latter region it is considerably higher. The difference is due to the sale of lands on the coast to negroes, on easy terms, after the war; in the main farming regions, on the other hand, few negroes have bought land.

In Kentucky, where the negro population is proportionately much less than in most of the other states under discussion, the proportion of negro owners of farms among all negro farmers is large.

Louisiana shows two areas in which the proportion of negro farmers is especially high, one bordering on the Mississippi and the other extending along the Red river. The proportion of ownership is large only in the southern portion of the state. It is interesting to observe, however, that the number of negro farm owners is largest along the Red river. In that section greater intelligence and the low price of land have encouraged ownership; on the other hand, the negroes on the plantations along the Mississippi are very ignorant, and are restricted by a rigorous crop-lien system.

In Mississippi the area in which is found the largest proportion of negro farmers includes all the counties along the Mississippi river, and also a small section on the eastern border of the state. The counties showing the largest proportion of ownership do not correspond with the areas above mentioned, but are in the central and southern portions. The region of the largest absolute number of owners centers outside the black belt, but overlaps it. It should be observed that for the state as a whole there has been a decided increase in negro ownership of farms, but it is probable that the comparatively high price of the rich lands along the Mississippi—which are owned, moreover, in large tracts—and the profits accruing to owners from tenant farmers tend to restrict negro ownership in those localities where the proportion of negro farmers is highest.

In the northern part of North Carolina, near the Virginia line, are two counties reporting a majority of negro farmers. These counties do not show the largest proportion of ownership, but they are among those having the largest absolute number of owners; it should be noted that negro owners of farms are comparatively numerous throughout the state.

In 28 out of the 41 counties in South Carolina there are more negro farmers than there are white farmers. Thus negroes form a majority of the farmers in two-thirds of the counties in the state. The actual number of owners and the proportion of ownership are largest along the coast, where many negroes secured farms as the result of events growing out of the war.

In Tennessee there are only 3 counties in which negro farmers constitute more than half of the total number, although the proportion is large in 4 others. The percentage of ownership in these counties is comparatively low, nearly all the counties in which the per cent exceeds 50 being in the eastern half of the state.

In Texas the largest proportion of negro farmers is found in the counties along the Brazos river, and in 3 adjoining counties in the northeastern part of the state.

Most of this territory is comprised in the areas having more than 300 negro owners to a county as shown

on Map 51, but most of the counties in which the per cent of ownership exceeds 50 lie farther west.

In Virginia, negro farmers are most numerous from the lower Potomac southwest to Mecklenburg county, on the North Carolina line, including the section around Richmond and Petersburg; there are 19 counties in which more than one-half of the farms are operated by negroes. Negro owners of farms are numerous throughout the state, probably because of opportunity long open to the race to secure land, and to some extent because of good educational facilities.

In West Virginia no section presents a high proportion of negro farmers. They are scattered in small numbers over the state, and generally own the farms they operate.

The relationship of density of negro population to land ownership can best be shown by taking certain typical states and grouping their counties according to the percentage of negro farmers: Let Alabama represent the gulf states; Texas, the southwest; South Carolina, the Atlantic seaboard; and Virginia, the border states. We have then the following table:

TABLE XLIV. PERCENTAGE OF FARM OWNERSHIP AMONG NEGRO FARMERS, IN COUNTIES GROUPED ACCORDING TO THE PERCENTAGE OF NEGRO FARMERS AMONG ALL FARMERS; FOR SELECTED SOUTHERN STATES.

STATE.	COUNTIES IN WHICH TWO-THIRDS OR MORE OF ALL FARMERS ARE NEGRO.					COUNTIES IN WHICH FROM ONE-THIRD TO TWO-THIRDS OF ALL FARMERS ARE NEGRO.					COUNTIES IN WHICH LESS THAN ONE-THIRD OF ALL FARMERS ARE NEGRO.				
	Number of counties.	Number of negro farmers.	Per cent which negro farmers form of all farmers.	Number of negro owners.	Per cent which negro owners form of all negro farmers.	Number of counties.	Number of negro farmers.	Per cent which negro farmers form of all farmers.	Number of negro owners.	Per cent which negro owners form of all negro farmers.	Number of counties.	Number of negro farmers.	Per cent which negro farmers form of all farmers.	Number of negro owners.	Per cent which negro owners form of all negro farmers.
Alabama	13	51,897	81.2	4,281	8.2	16	27,742	47.1	5,382	19.4	37	14,430	14.4	4,436	30.7
Texas	2	3,900	72.9	1,432	36.7	22	25,447	45.2	7,524	29.6	219	36,125	12.1	11,138	30.8
South Carolina	8	23,579	78.2	8,447	35.8	25	53,047	56.2	8,942	16.9	8	8,755	28.1	1,567	17.9
Virginia	.....	.....	.....	.....	.....	46	31,999	47.4	19,151	59.8	72	12,796	12.8	7,382	57.7

In the gulf states like Alabama the proportion of owners among negro farmers is largest in those counties where two-thirds or more of the farmers are white, and smallest in the counties where two-thirds or more of the farmers are black. This is due to the profitableness of tenant farming in the cotton belt, the concentration of land ownership there, and the general lack of any inspiring or uplifting influences. Illiteracy in these counties is very great, and historic conditions unfavorable. Whenever these influences are counteracted by educational institutions, as in parts of Alabama, or by new cheap land, as along the Red river in Louisiana, the proportion of ownership increases. The negro owners of the gulf states are largely concentrated in the lighter portions of the black belt—that is, in regions where from one-third to two-thirds of the farmers are black—the number of owners here among negroes being larger than in the white belts or the blackest portions of the black belt.

In western states like Texas the region of the largest proportion of black farmers is the region of the largest proportion of owners. This is because land is cheap and plentiful and the large plantation system of the past was never fully developed here.

In states like South Carolina we have again ownership and a dense black population in the same localities, but this is for a different reason—viz, government aid in the securing of lands directly after the war.

In the older border states like Virginia the percentage of ownership is high and does not appear to be much affected by concentration of negro population; this is because Virginia has turned in later years to crops which the tenant system of farming does not make profitable, and because of unusual educational facilities for negroes.

The validity of these comparisons is somewhat impaired by the fact that in the black belt, under the system of tenant farming, a very large number of persons must be classed as farmers by the census who are in reality little more than laborers. This decreases the apparent proportion of negro owners.

Thus it may be seen that a detailed study of ownership, state by state and county by county, reveals no hard and fast relation of the number of negro landowners to the black belt. We may, however, easily distinguish in the black belt two kinds of conditions: In the one case, the region is a black belt because economic conditions are favorable and the negroes migrate to or remain in the region, and enjoy there a fair degree of agricultural prosperity; in the other case the economic conditions are less favorable but they render emigration difficult by providing little education for the negroes, and by a general resort to the crop-lien system, under which the acquisition of landed property by negroes is impeded by the high value of the land. Sometimes these two sets of conditions are combined in the same region; sometimes they are separate, forming two belts of widely different economic prosperity.

TABLE XLV.—NUMBER AND ACREAGE OF FARMS OPERATED BY NEGROES, VALUE OF SPECIFIED CLASSES OF AND FERTILIZERS, WITH AVERAGES,

	STATE OR TERRITORY.	NUMBER OF FARMS.	ACREAGE, JUNE 1, 1900.			VALUE OF FARM PROPERTY: JUNE 1, 1900.

METHODS OF ESTIMATING POPULATION.

INTRODUCTION.

The results of the Federal census, giving the population of the several states and territories, are accepted without challenge, both by Congress and by the country. But the accuracy of the figures for the population of a city is sometimes disputed or denied. Criticism of this character is made usually in good faith and is entitled to candid consideration. It is the object of the following study to examine the bases for such criticism and indicate how far they seem adequate.

All such criticism of census figures assumes openly or tacitly either that a city's population can be determined in some other way with greater accuracy, or that an inconsistency between the census results and indications derived from other sources believed to be more accurate is warrant for rejecting the former. Various alternative ways of determining the population have been invoked, but for the purpose in hand the following are all that are important:

1. An estimate reached by assuming that the rate of growth between any two successive censuses is maintained during the following decade.
2. An estimate based upon the number of votes cast at an election.
3. An estimate based upon a school census.
4. An estimate based upon a directory canvass.

As these methods are used mainly in estimating the population of cities, this study has been confined for the most part to the 78 cities, each of which has over 50,000 inhabitants, and extended to the states only where information for the cities is lacking.

The data are derived in part from the published results of the Twelfth Census and in part from information contained in state and municipal documents courteously supplied to the Census Office by the secretaries of state, the state superintendents of public instruction, and other state or municipal officers. Where published figures of the Twelfth Census are used, reference is made to the source; the figures drawn from other authorities and used in the present study are reproduced in the last two tables to facilitate the critical examination of the results.

The main conclusions of the study may be summarized as follows:

1. In half of the 78 cities examined the per cent of growth between 1890 and 1900 differed by 18 or more from the per cent of growth between 1880 and 1890. Therefore the assumption that under present conditions the rate of growth of a given city tends to remain the same is inadmissible.

2. The number of votes cast at an election in a large city, affected as it is by the ratio of males to population, the ratio of adult males to all males, the ratio of citizens to all male adults, the ratio of legal voters to citizens, and the ratio of actual voters to legal voters, stands in no constant or uniform relation to the population. In Albany, Columbus, and Dayton there were less than 4 inhabitants to each vote cast at the Presidential election of 1900, while in several northern cities there were more than 8 and in certain southern cities more than 12 to each vote cast.

3. In the states and territories the increase of population runs by no means parallel with the increase of votes. Even when the Southern states are disregarded as having few large cities and exceptional conditions affecting the number of votes, still the per cent of gain in the vote for the decade is likely to be as much as 8 greater or less than the corresponding per cent for population.

4. The number of children of school age is a more accurate index of total population than prior rate of increase of vote cast. This method gives estimates of population, half of which fall within 6 per cent of the truth.

5. But the number of children of school age in a city is so seldom given with close accuracy by a school census, that this method is found of little practical value.

6. The ordinary method of estimating the population of a large city, that based on the number of names in the city directory, results uniformly in too large a figure and usually in very serious inaccuracy.

A quotation from Samuel Johnson, which James A. Garfield made in 1870, puts the whole subject in a nutshell: "To count is a modern practice; the ancient method was to guess and where numbers are guessed they are always magnified." A combination of counting and guessing is better than a guess not founded on a count, but when it differs from the results of a thorough and complete enumeration it is entitled to no standing.

To the general conclusion that none of the four ways of estimating population hitherto employed is worthy of use, it may be objected that negative results such as this are of little value; that city officials require for various purposes estimates of the city's population, are ready to accept the best simple method, but must have some method.

A method of estimating urban growth under present American conditions, which is certainly simpler and probably more accurate than any of the four here examined, may be commended to the consideration of interested city officials. This is to add for each year after 1900 one-tenth of the city's increase from 1890 to 1900. It is merely a rule of thumb and without rational justification. But between 1880 and 1890 the 78 cities together increased in population by an average annual amount of 407,028, and between 1890 and 1900 by an average annual amount of 414,793. As the rate of increase for the cities collectively fell from 46.8 per cent between 1880 and 1890 to 32.5 per cent between 1890 and 1900, but the total amount of increase between 1890 and 1900 exceeded by less than 2 per cent the total amount between 1880 and 1890, it is evident that the assumption of a constant amount is much nearer the truth than the assumption of a constant rate. If this method had been applied to the cities for 1900, the results in half the cases would have been within 6 per cent of the truth, closer than estimates based upon vote cast or number of names in the directory, and as close as the estimates resulting from an accurate census of school children, were that obtainable. From the point of view of local authorities, however, it may be an objection to this simple method that, on the basis of the estimates for 1900, it is as likely to result in an underestimate as in an overestimate, while the method now most in vogue, that based on the number of names in the city directory, produces nearly always an overestimate.

It is not the intention of this study to criticise the use of these methods where nothing better can be secured; the aim has been merely to give the reasons of the Census Office for doubting that the results of such methods are entitled to serious consideration when they contradict those of a careful enumeration.

COMPARISON OF METHODS.

1. *Estimates reached by assuming a constant rate of growth.*—The assumption that a city grew during the ten years from 1890 to 1900 at the same rate at which it grew during the ten years from 1880 to 1890 may be brought to the test of general American experience. The United States as a whole, excluding Alaska and the insular territories, increased between 1880 and 1890, 24.9 per cent, but between 1890 and 1900, 20.7 per cent, a decided reduction in rate of growth. Among the states and territories 19 grew at a higher rate and 29 at a lower rate in the last ten years than they did in the earlier decade.[1] In only two, Massachusetts and Tennessee, was the per cent of increase between 1890 and 1900 within five-tenths (0.5) of what it was between 1880 and 1890, and in half of the states and territories it differed from that of ten years before by more than five (5). So far as indications derived from the rates of growth in the states and territories can be applied to the cities, therefore, they show the chances to be even that the per cent of increase in a city during the ten years 1890 to 1900 would differ from its per cent of increase during the preceding ten years by 5 or more, and the chances would be about 25 to 1 against its per cent of increase during the second decade being within five-tenths (0.5) of what it was in the first.

But, as a rule, and other things being equal, the smaller the population the less the chance that its rate of growth from decade to decade will be the same. Hence cities as a class would be expected to show a rate of growth less uniform than that of states. How far this anticipation conforms to the facts appears from Table 1. This table shows for the last two decades, 1880 to 1890 and 1890 to 1900, the rate of growth of each of the 78 cities of the United States which in 1900 had over 50,000 people, and the differences between these rates. To make the evidence of the table clearer the cities are arranged in the order of this difference, those in which the rate of growth 1890 to 1900 was greater coming first, and those in which it was less, following. In no case, except that of New York city, has allowance been made for any change in the city's boundaries between 1880 and 1900.

Scrutiny of the table will show that in half of the cities the rate of growth between 1890 and 1900 differed by more than 18 per cent from the same city's rate of growth between 1880 and 1890; that is, in 39 of the 78 cities the increase between 1890 and 1900 was more than 18 per cent greater or more than 18 per cent less than it was during the preceding decade. If in the case of each city allowance were made for the effect of changes in city boundaries between 1880 and 1900, the table would be somewhat changed, but probably such corrections would not affect materially the inference to be drawn from it. As it stands it shows that American cities have a less constant rate of growth than the states and territories. It shows, also, that in default of evidence to the contrary the rate of growth in a city during the last decade would be likely to differ from its own rate of growth in the preceding ten years by 18 per cent. In only 1 of the 78 cities, Philadelphia, was the rate of growth the same during the two decades, and in only 4 did the rate during the second decade come within 1 per cent of that during the first.

We may conclude that the assumption on which this method of disputing census figures rests is without warrant in general American experience.

[1] Omitting Indian Territory and Oklahoma, where prior to 1890 no census was taken.

[1] Data from Twelfth Census Abstract, Table 8), or Twelfth Census, Vol. I, Table 7, pages 434–437.

2. *Estimates based upon the number of votes.*—The method just analyzed depends upon illegitimate deduction from census figures; all other methods rest upon results from some other source. To test them it is needful to examine the accuracy of the basis figures and of the argument by which the total population is inferred therefrom.

A city's population is often estimated by multiplying the total vote at a recent election by some round number, such as 5. The abstract of vote cast is found in official documents, which may be assumed to be substantially accurate, though minor numerical errors frequently exist. How near to the truth is the assumption that the total population of a city is likely to be about five times the number of votes? It is evident that the ratio of votes to population must tend to vary as one or more of the following elements varies:

1. The proportion of males in the total population except in the cases of Denver and Salt Lake City, where women are entitled to vote.

2. The proportion of males of voting age—that is, 21 or over in the total male population.

3. The proportion that the citizens make of the total males of voting age. By "citizens" is meant those who by birth or naturalization are citizens of the United States. The term for present purposes also includes in a few states aliens who have indicated an intention to become naturalized, by taking out first papers, and who are allowed after a fixed time to register and vote.

4. The proportion of "citizens" as thus defined who satisfy the legal conditions of residence in the state, city, and voting district required as a prerequisite to voting.

5. The proportion of resident "citizens" who possess at the given election the educational or other qualifications, or have paid the tax imposed in some states as a condition of voting.

6. The proportion of qualified voters who exercise their right to vote at the election in question by casting a ballot.

7. The proportion of ballots cast that appears in the largest total vote.

Of the foregoing conditions influencing the ratio of votes counted to total population not all are subject to statistical measurement. The census reports the number of each sex, the number of males of voting age, and the number of aliens. But neither from the census nor from any other source of information can

the number of "citizens" who meet the residence, educational, or tax requirements, be derived. The election returns, as published, seldom give the total number of ballots counted, but only the total for each of a list of candidates and the scattering. Election returns were requested from the secretaries of state, but for 18 of the 78 cities could not be had. The figures reported were not used for Salt Lake City, because women have the ballot there, nor for Troy, because the election returns related to a larger area than the census returns. Washington, D. C., has no part in a Presidential election.

In the following table a statistical measure is presented for all the measurable elements affecting the ratio of votes cast to total population. Column 1 gives the per cent of males in the total population; column 2, the per cent of males over 21 years of age in the male population; column 3, the result of combining 1 and 2, the per cent of males over 21 years of age in the total population; column 4, the per cent of "citizens," so far as the census has enumerated that class, in the total adult male population; column 5, the per cent of the votes cast at the Presidential election of 1900 to all "citizens"; column 6, the result of combining 4 and 5, the per cent of the votes cast at the Presidential election of 1900 to the males over 21 years of age; and, finally, column 7, the combined result of all the factors, gives the per cent of the votes cast to the total population. The largest and smallest figures in the column in which they stand are printed in italic in order to call attention to the range of difference among the several cities in the matter to which the column relates. Thus, in the first column, Charleston, S. C., has the lowest and Seattle, Wash., the highest proportion of males to total population, and the difference between these two italicized figures, 18.0, is the range among the 78 cities in reference to this particular.

TABLE II.—PERCENTAGE FIGURES BEARING UPON THE RELATION BETWEEN TOTAL VOTE CAST AND TOTAL POPULATION FOR CITIES HAVING AT LEAST 50,000 INHABITANTS: 1900.[1]

CITY.	Per cent of males in total population.	Per cent of males over 21 years of age in total male population.	Per cent of males over 21 years of age in total population.	Per cent of "citizens" in total males over 21 years of age.	Per cent of votes cast Nov. 6, 1900, to total "citizens."	Per cent of votes cast Nov. 6, 1900, to total males over 21 years of age.	Per cent of votes cast Nov. 6, 1900, to total population.

[1] Data from Twelfth Census Abstract, Tables 81 and 86, or Twelfth Census, Vol. I, Tables 23, 80, and 82 (pages 609, ff.; 930, ff.; and 936, ff.), and from Table IX of this study.
[2] Right of franchise extended to women.
[3] Ratio for the 58 cities for which election returns were available.

The first column of Table II shows that the male population of these cities as a whole is a trifle less than half (49.7 per cent) of the entire population, but that in the several cities the proportion is by no means the same. Closer examination, however, shows that in 61 of the 78 cities, or nearly four-fifths, the male population is between 47 and 51 per cent of the total, and in half of them it is between 48.5 and 50.5 per cent. Aside from a few cities, where the male population is greatly in excess, the proportion of the sexes does not depart far from equality.

From the second column of Table II it appears that the male adults are just three-fifths (60.0 per cent) of the total male population. In Salt Lake City they are little more than half (52.8 per cent); in Seattle, more than three-fourths (76.7 per cent). In nearly half (38) of the cities the male adults are between 58 and 62 per cent of the total number of males.

The third column of Table II, presenting in combination the two preceding columns, shows that in Charleston only about one-fourth (25.4 per cent) of the population are adult males, while in Seattle nearly one-half (49.0 per cent) are adult males. Nearly three-tenths (29.8 per cent) of the population of the 78 cities taken collectively are potential voters.

In advancing from the topic of sex and age composition to that of "citizenship" the statistical basis becomes less secure. The requirements for "citizenship" vary in the several states. In most of them aliens are not allowed to vote, but in a few states, as already explained, aliens who have indicated their intention to become citizens by taking out first papers and have resided in the state for a specified time thereafter are given the privilege of the ballot, and thus for the purposes of this discussion are "citizens." The Twelfth Census inquired about each foreign born male adult, whether he was an alien, had taken out his first papers, or was a full-fledged citizen of the United States. But the enumerators were often unable to obtain this information. In Fall River one-ninth (11.2 per cent) and in Manchester one-tenth (10.3 per cent) of the adult males were persons of foreign birth whose condition of citizenship was not reported. In the computations, the results of which are presented in the fourth and fifth columns of Table II, the number of "citizens" has been obtained by subtracting from the total number of

males over 21 years of age the aliens and, except in the few states where they are allowed to vote, the foreign born who have advanced toward citizenship only so far as to have taken out their first papers. The total thus reached would include substantially all who would be entitled to vote, together with some who would not, because of failure to meet the residence, educational, or tax requirements.

From column 4 of Table II it appears that in these 78 cities nearly nine-tenths (88.8 per cent) of the men are citizens or of unknown status, and probably entitled to vote, provided they meet the other requirements of the state or territorial law. In Fall River the ratio is lowest (72.1 per cent), while in Evansville it is highest (99.6 per cent).

No information could be obtained which would serve even approximately as a statistical measure of the influence exercised separately by any one of the last conditions in the preceding list of those affecting the ratio of votes cast to population (page 582). They are important factors, but elude separate statistical measurement. The ratio of votes cast November 6, 1900, to the total number of citizens, however, is some index of the joint effect exercised by these four conditions. To obtain the ratio, the vote cast at the Presidential election of 1900 was analyzed with the aid of information furnished through the courtesy of the respective secretaries of state. To determine the total number of votes cast and counted in each city, the following figures were compared, so far as they were obtainable:

1. The sum of the votes for the Presidential electors receiving the largest number of votes in each party.

2. The sum of the votes for the several candidates for election to the national House of Representatives.

3. The sums of the votes for the several candidates for governor and other state offices.

The largest of these sums was assumed to be the best approximation to the total number of votes cast. In this way the totals found in Table IX (page 593) were obtained, and from them the per cents presented in columns 5, 6, and 7 of Table II were computed.

In these columns only 58 of the 78 cities are included. For 18 cities the secretaries of state were unable to supply the needed information. Among them was Chicago, but as the figures for Cook county were available and as 92.4 per cent of its population live in Chicago, the figures for Cook county have been employed.

Column 5 of Table II shows that in the 58 cities here included the vote cast November 6, 1900, amounted to over seven-tenths (71.5 per cent) of the "citizen" population, and that the several cities differed more in this per cent than they did in any of the preceding, the vote in Savannah being about one-fifth (21.5 per cent) of the "citizen" population and in Grand Rapids over nineteen-twentieths (95.7 per cent).

In order to avoid the objection that the number of "citizens" obtained in the manner already explained must involve some errors, a sixth column has been added, wherein is given the ratio that the vote cast November 6, 1900, bears to the entire adult male population.

From column 6 it appears that the votes cast November 6, 1900, in the 58 cities were about five-eighths (63.0 per cent) of the total male population of voting age; in Savannah only about one-fifth (21.0 per cent) of the adult male population voted, and in Dayton seven-eighths (87.5 per cent) voted.

The seventh and last column of Table II shows the net result of the six preceding. It appears that in the 58 cities about one-sixth (18.8 per cent) of the population voted at the Presidential election of 1900. In determining the average given in the last line of this column the figures for Salt Lake City have been excluded, since in that city alone of those appearing in this column women are entitled to vote. This explains the very high proportion of votes cast to total population in Salt Lake City. With that exception the largest proportion was found in Dayton, where over one-fourth of the population (26.4 per cent) voted. The lowest per cent was in Atlanta, where only about one-seventeenth (5.7 per cent) voted. The great range between these extremes is sufficient evidence that in the different American cities the vote cast bears very different ratios to the population, and that the assumption of a uniform ratio between these elements can not be admitted.

To bring out this conclusion with greater clearness, Table III has been prepared. It employs not the usual census method but the ordinary or popular method of stating the numerical relation between the vote and the population; that is, not as a per cent, but as the number of inhabitants to each vote. The cities are arranged, not geographically, but according to the size of the ratio.

TABLE III.—NUMBER OF INHABITANTS, JUNE 1, 1900, TO EACH VOTE CAST NOVEMBER 6, 1900.

Salt Lake City, Utah	2.73	Rochester, N. Y	4.60	Buffalo, N. Y	5.17	Boston, Mass	6.70

Wilmington, Del	4.57	Bridgeport, Conn	5.11	St. Paul, Minn	6.40	Atlanta, Ga	17.61
Chicago, Ill	4.58	Detroit, Mich	5.16	Worcester, Mass	6.50		

Table III shows how very wide of the mark in nearly all of these cities would be an estimate of the population made by multiplying the vote cast by any single ratio, and that this method of estimating a city's population is without foundation.

While Table III proves that no single ratio for the different American cities is possible, it might still be urged that the ratio of a city once determined would remain approximately constant for a series of years. It has been found impracticable at this date to get the figures for the vote of these cities in 1880 and 1890, and so to examine this objection in the light of city election statistics. But the figures for the states and territories have been obtained, and from them Table IV has been prepared. After searching all accessible state publications, about two-fifths of the figures for 1880 and 1890 had to be drawn from such private publications as the American Almanac and the Tribune Almanac.

As no Presidential election was held in 1890, and as the vote at other elections is usually smaller, the vote in 1890 was estimated by taking the average of the vote for Presidential electors in 1888 and 1892, except for 5 states, in which the vote in 1890 for some state officer was higher than the average thus obtained. Aside from this difference, the method of determining the highest vote was like that already described for the cities (page 585), but more laborious, because the votes for a longer list of officers were available for comparison.

Where local criticism of census figures has been made, it has not infrequently taken this form: The vote cast in 1900 increased over that of 1890 by such a per cent and the reported population by a per cent so much smaller as to seem incredible. In the form stated the objection overlooks the fact that the vote in 1890 was smaller in most states and cities than it would have been had a President been elected in that year. But when this difficulty is met, as in the method here employed, by estimating the vote in 1890 from the average of the votes for 1888 and 1892, the question still remains: Does the increase in population run closely parallel with the increase in votes? Light is thrown upon the question by Table IV. It has been cast in the form of a comparison by states and territories between the increase of population and the increase of votes during the last two decades.

TABLE IV.—PER CENT OF INCREASE IN POPULATION AND IN VOTE CAST, 1890 TO 1900 AND 1880 TO 1890.[1]

STATE OR TERRITORY.	PER CENT OF INCREASE, 1890 TO 1900.		PER CENT OF INCREASE, 1880 TO 1890.

[1] Data from Twelfth Census Abstract, Table 36, or Twelfth Census, Vol. I, Tables VI and 2, and from Table X of this study.
[2] Woman suffrage granted in Colorado, Idaho, and Utah between 1890 and 1900.
[3] Woman suffrage granted in Wyoming in 1889.

In the United States as a whole the divergence at each decade between the rate of increase of population and that of votes is not wide. In the earlier period the vote increased about 2 per cent faster than the population; in the later, the relation of the two was reversed.

But in the five great groups of states a much greater diversity appears. Between 1880 and 1890 the population of the North Atlantic, South Atlantic, and Western divisions increased more rapidly than the vote, while in the North Central and South Central divisions the rates of increase in the vote were the greater. Between 1890 and 1900 the population of the North Atlantic, South Atlantic, and South Central groups increased much more rapidly than the vote; in the North Central and Western groups the increase in vote was the more rapid.

The real test of the hypothesis, however, is found neither in the figures for the United States as a whole, nor in those for the five divisions, but in those for the several states. The table shows for the two decades 94 cases in which there might be a coincidence between the rate of increase of population and that of vote cast. In only 4—namely, Connecticut and Oregon from 1880 to 1890, and Michigan and Wisconsin from 1890 to 1900—were the two rates within 1 per cent of agreeing. This indicates that in American states and territories under present conditions there is not one chance in twenty that the increase of population will keep even pace with that of votes cast. In half of these 94 instances the per cent of decennial increase of population differed from that of vote cast by more than 12. The table shows, also, that the variation between increase of votes and increase of population in the Southern and Western states is much greater than it is in the North Atlantic and North Central divisions, where most of the great cities of the country lie. But even in the North Atlantic and North Central states, in half of the 41 cases the per cent of decennial increase of population differed by 8, or more, from the per cent of decennial increase in vote cast. Evidence previously offered has shown that the variations in such figures for cities are usually greater than they are for states. Hence the argument applies to cities *a fortiori*, and the conclusion that in no way can a sound inference be drawn from the figures of vote cast to the population of a city seems established beyond reasonable doubt.

3. *Estimates based upon a school census.*—Most of the states and territories provide by statute for a periodical census of the population of school age. It is usually taken annually and the results published in state and municipal reports. For the purpose of such a census the school age, as specified by statute, is not the same in the several states and territories, the lower limit ranging from 4 to 8 years and the upper from 14 to 20 years. The smallest number of years included is 10 and the highest 17. The most ordinary limits are 6 and 20, and 5 and 20, the former established by 11, the latter by 9 states. From the number of persons of school age as thus returned, an estimate of the population of a city is sometimes derived by multiplying that number by the ratio which the total population is thought to bear to persons of this age class. The accuracy of such an estimate depends upon the accuracy of the ratio and the accuracy of the school census.

The ratio that naturally suggests itself as the best to employ in such a case is that derived from the figures of the next preceding census for the city under examination. Table v has been constructed to test the accuracy of this assumption. The limits of school age used by the Federal census, namely 5 to 20, inclusive, have been adopted, no other being available.

TABLE V.—RATIO OF CHILDREN OF SCHOOL AGE (5 TO 20) TO POPULATION IN 1900 AND 1890, AND PER CENT OF ERROR IN ESTIMATES REACHED BY USE IN 1900 OF RATIO ESTABLISHED IN 1890, FOR CITIES HAVING IN 1900 AT LEAST 50,000 INHABITANTS.[1]

CITY.	NUMBER IN TOTAL POPULATION TO EACH PERSON OF SCHOOL AGE (5 TO 20)—		Per cent of error in population as estimated by multiplying number of persons 5 to 20 in 1900 by ratio of total population to persons 5 to 20 in 1890.

[1] Data from Twelfth Census Abstract, Table 84, or Twelfth Census, Vol. I, Table 19, and Eleventh Census, Population, Part I, Table 72, page 742.
[2] Estimate too high.

The first entry on the last line of the table shows that the number of children 5 to 20 years of age in 1900 for all the 78 cities collectively must be multiplied by 3.33 to get the entire population in 1900. But at the time these estimates were needed and made the census of 1890 was the last for which the figures were available, except for cities lying in states which had taken a state census between 1890 and 1900. The ratios for 1890 are given in the second column of Table v. The entry in the last line of this column shows that the number of children 5 to 20 years of age in 1890 for all the 78 cities collectively must be multiplied by 3.22 to get the entire population in 1890. To estimate the population in 1900 of any city on the list, its population of school age, which is supposed to be known, might be multiplied by the ratio which the total population bore to the number of persons of school age in 1890. The per cent of error resulting from this method of estimate is given for each city in column 3. In 68 of the 78 cities an estimate so reached would be too small, this being due, as shown by examination of columns 1 and 2, to the decreasing proportion of children of school age in most of these cities. The average error of these 78 estimates is 5.7 per cent.

The evidence indicates that, if the number of children of school age is known, an estimate of a city's population can be made therefrom with greater accuracy than from the population of the last two censuses or from the number of votes cast at a Presidential election.

The point remaining for examination is the accuracy of school censuses. By correspondence with state and municipal officers the figures for school censuses in 1900 have been obtained for 47 cities. But in only 4 are the age limits the same as those published by the Federal census, namely, 5 to 20, and, in consequence, the information from these sources can not be compared with much confidence in the results. For the states and territories, however, the Twelfth Census reports the population by single years of age, and therefore the results of a state census of persons of school age can be readily compared with the population within the same age limits as enumerated by the Federal census. Such a comparison covering 33 states and territories is presented in Table vi.

TABLE VI. COMPARISON OF STATE SCHOOL CENSUSES OF 1900 WITH RESULTS OF TWELFTH CENSUS.

STATE OR TERRITORY.	Age limits for state school census.	Persons of school age by state census.	Persons within same age limits enumerated by Twelfth Census.	Probable per cent of error in state school census.
Arizona	6 to 17	20,833	28,835	−27.8
Arkansas	6 to 20	484,619	490,581	−1.2

North Carolina	6 to 20	659,629	699,696	−5.7
North Dakota	6 to 19	92,009	98,148	−6.3
Ohio	6 to 20	1,226,366	1,252,593	−2.1
Oklahoma	6 to 20	127,921	136,620	−6.4
Oregon	4 to 19	133,181	133,562	−0.3
Rhode Island	5 to 15	82,239	84,888	−3.1
Tennessee	6 to 20	768,843	726,405	+5.8
Texas	8 to 17	706,546	757,574	−6.7
Utah	6 to 17	62,297	82,446	−24.4
Vermont	5 to 20	90,648	98,614	−8.1
Washington	5 to 20	139,097	158,245	−12.1
West Virginia	6 to 20	307,581	331,508	−7.2
Wisconsin	4 to 19	731,063	744,517	−1.8

Inspection of this table shows that in the majority of cases—26 out of 33—the school census was deficient by amounts ranging between 0.2 per cent for Idaho and 27.8 per cent for Arizona. In the 7 states in which the state count returned more children than were found by the United States census the per cent of excess ranged from 1.9 for Missouri to 15.0 for California. In 16, or about one-half, of the total number of states included in this comparison, the probable error in the state census was greater than 5 per cent. It is probable that the state school censuses do not include Indian children of school age, and that this partly accounts for the marked deficiencies in several Western states. But even in the Eastern states the results are so divergent as to cast doubt upon the state censuses of school children.

It might be urged that to count the children of school age in cities is far easier than to count them throughout an entire state, and that the city school censuses may be more accurate than would appear by analogy from Table vi. The force of the objection may be weakened, if not destroyed, in the following way: The population of nearly all our large cities is increasing decade by decade, and probably also year by year. If so, the number of school children should increase slowly but steadily. A bad census, except in the rare cases where fraud is an element, results almost invariably in an undercount. If the city school censuses as a class are sometimes bad and sometimes good, this will probably be reflected in very irregular increases from year to year in the reported number of school children. Indeed, a careless census taken the year after a thorough one might report a smaller number of school children than was found by its predecessor. To show the irregular increases in the reported number of school children Table vii has been

prepared. It includes figures for the 38 cities regarding which the facts have been secured. The first column gives the highest amount and the third the highest per cent of increase in the reported numbers of school children at two successive years between 1890 and 1900; the second column gives the lowest amount and the fourth the lowest per cent of increase, or, where there has been a decrease, the highest per cent of decrease between any two such years; the fifth column gives the difference between the third and fourth, and so measures roughly the fluctuations in the reported figures for the ten years. A small figure in column 5 is an indication, although not a proof, that the school censuses for each year have been accurate; a large figure in column 5 is an indication that some, at least, of the school censuses in that city between 1890 and 1900 were inaccurate.

TABLE VII.—LIMITS IN AMOUNT AND IN RATE OF INCREASE OF PERSONS OF SCHOOL AGE FOR ANY YEAR BETWEEN 1890 AND 1900.

CITY.	AMOUNT OF INCREASE FOR ANY YEAR BETWEEN 1890 AND 1900.		PER CENT OF INCREASE FOR ANY YEAR BETWEEN 1890 AND 1900.		Range of per cents, i. e., difference between two preceding columns.

It is hardly possible to demand more evidence than is contained in Table VII, that city school censuses as a class are not entitled to implicit acceptance. In 29 of the 38 cities the number of school children enumerated at some year between 1890 and 1900 was less than the number enumerated the preceding year. The conclusion may be confirmed, however, by quoting a few typical admissions found in the reports.

DETROIT.—"The result of the census enumeration for several years past has been very unsatisfactory." (Board of Education Annual Report, 1893, p. 14.)

JERSEY CITY.—"The utter unreliability of these returns renders them, as has been proved, a very unsafe guide." (Board of Education Annual Report, 1897, p. 50.)

"Enough has been given to show that error is generally prevalent in the census reports of the whole state." (Ibid., 1898, p. 34.)

CAMBRIDGE.—"School returns show more children in the schools, public and private, than were found by the enumerators." (School Committee Annual Report, 1899, p. 53.)

NEW BEDFORD.—"The returns this year prove that the census of 1896 was short from 500 to 700 children." (School Committee Annual Report, 1897, pp. 4, 5.)

SYRACUSE.—"The results of the enumeration were totally void of any reliable information." (Board of Education Annual Report, 1895, p. 21.)

On the whole, therefore, city school censuses and *a fortiori* estimates of total population based upon them do not compare in accuracy with a complete enumeration.

4. *Estimates based upon a directory canvass.*—An estimate of population is based more often perhaps on the number of names in the city directory than on any other figure. This is not due to the fact that the number of names in the directory is a more trustworthy index of population, but to the fact that many publishers of directories in each issue estimate the population. During the canvass they gain information that would be of much service in making an estimate, and are better prepared than others for the task. The directory estimate, based upon information gained annually and published by well-known firms, is given a wider circulation than is accorded to estimates made in other ways. Even where a directory publisher does not print an estimate in the directory, as is true in the majority of cases, he may give one out to the local newspapers, based upon the results of his canvass, or other persons may make estimates resting on the number of names in the directory.

These estimates are made by multiplying the number of names in the directory by a ratio assumed to represent the most probable number of persons in the total population to each name in the directory. It is more usual for directory publishers to print the number of names contained in the directory than it is for them to base thereon an estimate of the city's population. They seldom explain, however, the meaning of this phrase "number of names," and it does not, as might at first be thought, carry its meaning on its face. Does it include not merely persons, but firms, buildings, societies, and public institutions, of which entry is frequently made in the directory? Does it include each entry of the same name where two or more such entries appear as cross references? The meager evidence obtainable indicates that "number of names" means number of entries. In that case a considerable per cent of duplicates or inadmissible entries is involved. This per cent may be different in the same city for different years. Another possibility of error arises in the fact that the names in very few directories are carefully counted; usually the number of names stated is an estimate.

Furthermore, the entries in a directory do not include the names of all adults, for those of married women seldom appear. Unmarried women living with their families and not engaged in any business are usually omitted. The age limit below which persons are excluded varies from 16 to 21. In a large city many men may be regarded as floating or transient population. Their addresses change so often that it is of little use to include them in a directory. Their social or business importance is so slight that the value of the directory to its public would be little heightened if all their names appeared. The proportionate importance of this class, and the directory publisher's treatment of it, vary in the different cities and probably from time to time in the same city.

The directory publisher is not bound in any way to restrict his list to persons residing within the corporate limits of the municipality. A great many persons residing outside, but doing business in the city, are included in the city directories. Oftentimes residents of those suburbs which are an integral part of the city, viewed as a business center, are included even when they do not have a place of business within the corporate limits of the larger city.

The starting point of a directory must usually be the directory of the same city for the preceding year. Many of the residents have died or removed since the previous canvass. Many others have come to reside in the city since that time, or have begun business there. The names of the former must be expunged, those of the latter added. To get the necessary information and decide upon each case takes time and money. The efficiency with which this work is done varies in the different cities and in the same city at different periods.

For all these reasons the phrase "number of names" does not sharply define any class of the population, and in consequence the ratio between the "number of names" and the population is not likely to be uniform. This is indicated by noting that, where directory publishers have estimated the total population during the last ten years by multiplying the number of names in the directory, the figure used as a multiplier varied from 2 to $5\frac{1}{4}$, and in most cases it was a simple number, namely, $2\frac{1}{4}$, $2\frac{1}{2}$, $2\frac{3}{4}$, 3, $3\frac{1}{4}$, or $3\frac{1}{2}$. Round numbers like these carry on their face a demonstration that they are the results of guessing rather than of accurate calculation. The evidence shows that the ratio between the number of names in a directory and the population is almost unknown, but varies with the age and sex composition of the population and the conditions and rules of the directory canvass.

A directory compiler doubtless amasses local information which might enable him to estimate closely the population of his city, provided he were an expert in making estimates, gave his attention seriously to the subject, and were animated only by a desire to get as near as possible to the truth. But in the great majority of directories examined the indications are that some of these conditions are lacking. Not a single directory bears evidence that the author of the estimate appreciated the difficulties in the way of an accurate result from the information before him. His estimate is a mere incident to his main object and receives little attention. It is usually dismissed in a sentence with no explanation of the method employed, often with no statement of the ratio adopted, and no indication of the evidence on which it rests. Most directories omit it entirely, thereby indicating that they regard it as aside from their real work.

It is a notorious fact that in many cities of the United States public sentiment is in favor of having the population appear as large as possible. There are no strong motives for an underestimate; there are many motives of local pride and business rivalry for an overestimate. These are likely to weigh with the maker of a directory appealing exclusively to local patronage, but to a varying extent in different cities. Opposed to them are the business integrity and judgment of the directory maker and his unwillingness to make an estimate so wide of the truth as to arouse criticism. Motives of the former character have apparently influenced certain directory makers to count for purposes of an estimate names of deceased persons, of nonresidents, and of others not entitled to recognition. They have also influenced some to exaggerate the true ratio of "number of names" to population.

Table VIII is designed to test the serviceability of directories for the purpose under consideration. The first three columns throw light upon the publishers' estimates. The first gives the ratios of the "number of names" to population; the second, the ratios used by the publishers; and the third, the per cent of error in their estimates. Column 4 gives the rate of decennial increase in population, and column 5, the rate of decennial increase in "number of names."

TABLE VIII.—FIGURES RELATIVE TO POPULATION ESTIMATES BASED ON "NUMBER OF NAMES" IN DIRECTORY.

CITY.	Number of persons in total population to each name in directory, 1900.	Number of persons in total population to each name in directory assumed by publisher, 1900.	Per cent of error in publisher's estimate, 1900.	PER CENT OF INCREASE, 1890 TO 1900.	
				In population.	In names.

Oakland	1.75	2.22	26.7		

Table VIII shows that the ratios of "number of names" to population ranged from 1.75 to 3.21; and those used by the publishers, from 2.08 to 3.50. Of the 14 estimates, but 4 are in error by less than 10 per cent; in 6 the error is from 10 to 20 per cent; and in 4 it is over 20 per cent. All of the estimates are too large. Only one instance has been found, either in 1900 or 1890, where a directory estimate was not in excess of the population as returned by the census.

If an estimate of population were based upon the "number of names" in 1900, as compared with that in 1890, the per cent of increase of population would probably be assumed to equal that of "number of names." Columns 4 and 5 present the figures for 31 of the 78 cities and show that the "number of names" has increased more rapidly than population. In but 7 of the 31 instances is the per cent of increase in population greater than that in "number of names." This more rapid increase in the "number of names" witnesses probably to the greater care and thoroughness with which the work of directory publishing is done, to a tendency of the publishers to include a larger proportion of the doubtful classes, like unmarried women, or children just entering adult life, and also to a growing tendency among persons doing business in large cities to reside in the suburbs. For these reasons the directory is likely to give an exaggerated idea of the true resident population. On the whole, therefore, the evidence warrants the conclusion that this method of estimating population, like the other three, is not entitled to public acceptance or to any weight as a basis upon which to dispute the accuracy of a careful enumeration.

In the two tables which follow, all the data used in the present inquiry and not contained in the published results of the Twelfth Census are presented. They afford a means of checking the results which have been set forth. Perfect accuracy can not be claimed for these tables, but the figures are the best that the Census Office has been able to secure.

TABLE IX.—NUMBER OF "CITIZENS" AND VOTE CAST IN 1900, NUMBER OF NAMES IN DIRECTORY IN 1890 AND 1900, AND DIRECTORY ESTIMATE OF POPULATION IN 1900.

CITY.	Number of males of voting age who possess the "citizenship" qualifications.	Vote cast.	NUMBER OF NAMES IN DIRECTORY. 1900	1890	Directory estimate of population in 1900.
